## 3.13 Recreation Resources

This section provides baseline information regarding outdoor recreation uses on public and private lands that could be affected by the Project in Wyoming, Colorado, Utah, and Nevada. Included within this section is a description of the existing recreational opportunities and activities, recreation use estimates for BLM and USFS lands in the analysis area, a description of the recreation sites that occur in each region of the analysis area, and an overview of the plans and regulations of federal, state, and local land management agencies that provide recreation opportunities in the analysis area. Direct effects to other resources that indirectly affect recreation are discussed in those respective sections, including Section 3.7, Wildlife; Section 3.5, Vegetation; Section 3.12, Visual Resources; and Section 3.16, Transportation and Access.

# 3.13.1 Regulatory Background

A variety of federal, state, and local land management agencies serve as recreation providers in the analysis area, including USFS, BLM, USFWS, Bureau of Reclamation, NPS, various state agencies that regulate recreation uses on state lands, and local and county governments. These entities guide recreation activities on public lands with management plans developed under their guiding authority. The following sections summarize the management plans for federal, state, and county/municipal agencies that manage recreation within the analysis area.

## 3.13.1.1 Federal Plans, Policies, and Regulations

## **BLM**

All BLM-administered public lands in Wyoming, Colorado, Utah, and Nevada are managed in accordance with the approved RMP or MFP for each BLM FO. Each RMP/MFP provides goals, objectives, and management actions to guide recreational uses of BLM-managed land resources within the FO. BLM RMPs that are pertinent to the project are listed in **Table 1-3**. In addition, the BLM prepares a variety of planning documents related to its recreation and visitor services program, including interpretive plans and travel management plans.

### **USFS**

The USFS conducts planning activities and administers NFS lands in accordance with provisions of the NFMA of 1976, NEPA, and other applicable legislation and regulations. A LRMP is required for each forest and provides direction for all resource management programs, including recreation uses. The USFS LRMP and EIS documents pertinent to the project are listed in **Table 1-4**. Other USFS planning documents that identify recreational opportunities and facilities, and provide guidance for recreation uses within the analysis area are listed in **Table 3.13-1**.

## USFWS/NPS/Bureau of Reclamation

Although most public lands within the analysis area that are managed by a federal agency are managed by the BLM or USFS, there are areas managed by the USFWS, NPS, and Bureau of Reclamation in Colorado, Nevada, and Utah. Typically the agency has a management plan that includes goals, objectives, policies, and/or regulations pertaining to recreation within their management area or agreements with local agencies for management. A list of these plans is included in **Table 3.13-1**.

## 3.13.1.2 State Plans, Policies, and Regulations

State lands within the analysis area include state parks, wildlife management areas (WMAs), and other special management areas that include recreational uses of the land resources. Planning documents that identify recreational opportunities and facilities, and provide guidance for recreation uses in various state management areas within the analysis area are listed in **Table 3.13-1**.

Table 3.13-1 Federal and State Recreation Planning Documents for Managing Recreation

State	Planning Document	Agency
Wyoming	2004 Wyoming Statewide Trails Plan	Wyoming Department of State Parks & Cultural Resources, Division of State Parks & Historic Sites  - Trails Program
	Wyoming Statewide Comprehensive Outdoor Recreation Plan 2009-2013	Wyoming Department of State Parks and Cultural Resources, Division of State Parks, Historic Sites and Trails
	Continental Divide National Scenic Trail Comprehensive Plan 2009	USFS
Colorado	Colorado Statewide Comprehensive Outdoor Recreation Plan 2008-2012	Colorado Parks and Wildlife
	Colorado Division of Wildlife: Chapter 9 – Division Properties; Regulations Applicable To All Division Properties 2012	
	Dinosaur National Monument General Management Plan 1986	NPS
	River Management Plan 1979	
Utah	Utah Statewide Comprehensive Outdoor Recreation Plan 2009	Utah State Parks
	Starvation Reservoir Resource Management Plan 1999	Bureau of Reclamation
Nevada	Nevada Statewide Comprehensive Outdoor Recreation Plan 2010	Nevada State Parks
	Clark County Wetland Park Master Plan	Clark County/Bureau of Reclamation
	Desert National Wildlife Refuge Complex Final Comprehensive Conservation Plan and EIS 2009	USFWS
	Lake Mead National Recreation Area General Management Plan 1986	NPS
	Land Protection Plan 1987	
	Lake Management Plan 2003	

State-owned lands within the analysis area that are not part of designated management areas, such as state parks or wildlife management areas, include lands held in trust and managed by a designated state agency (State Land Board, Office of State Lands) to produce income to support public schools and other state institutions.

Statewide Comprehensive Outdoor Recreation Plans (SCORPs) have been prepared by the states of Wyoming, Colorado, Utah, and Nevada. A SCORP provides statewide policy direction for recreation; identifies statewide outdoor recreation issues; and provides an implementation program that identifies the state's strategies, priorities, and actions for recreation, including the allocation of federal grants to recreation programs and facilities. Each SCORP is a collaborative effort developed with the assistance and support of a diverse array of recreation stakeholders representing local, state, and federal agencies; non-profit groups; outdoor industry groups; and other organizations directly linked to outdoor recreation.

# 3.13.1.3 County Plans, Policies, and Regulations

General Plans or Comprehensive Plans for a county (including master plans or land use plans) generally consist of a map or maps showing existing and planned land uses, as well as descriptive text identifying objectives, goals, policies, and standards or actions used to implement the plan. Each comprehensive plan includes a plan element for parks or open space, and recreation. This plan element identifies an overall vision or direction for recreation as it relates to community needs, and provides direction for specific facilities and opportunities. A tabulation of county planning documents is contained in Section 3.14, Land Use.

# 3.13.2 Data Sources

The recreational resources in the analysis area were identified from a variety of public sources and from field reconnaissance conducted during January through March of 2011. Recreation information for public lands administered by the BLM and the USFS were identified from a review of available data in affected BLM Field Office RMPs and websites, and USFS National Forest LRMPs and websites. BLM recreation specialists or other field office personnel were contacted to acquire available BLM data in a digital or hard-copy format. In addition, designated parks and open spaces on county and municipal lands were identified from the recreation and open space elements of Comprehensive Plans, General Plans, and other land use management plans adopted by counties and incorporated cities within the analysis area. Scenic Byway information was obtained from data provided by the National and State Scenic Byway programs website.

# 3.13.3 Analysis Area

The alternative routes and ancillary facilities are located within 23 counties in four states and include federal lands managed by the BLM, USFS, various state agencies, municipal lands, and private lands. The majority of recreation resources within the analysis area occur on federal lands managed by the BLM and USFS.

The analysis area for characterizing recreation resources comprises all public general recreation areas and special recreation management areas for which any portion of the area is contained within a 2-mile transmission line corridor centered on the 250-foot-wide transmission line ROW or within additional project areas (terminal, ground electrode siting areas, etc.). The 2-mile transmission line corridor was used to analyze impacts to recreation resources because it would include all access roads, substations, and other permanent or temporary facilities and because it would largely encompass all potential intrusions experienced by the public from the 250-foot-wide transmission line ROW. Context for the impact to recreational areas and uses is obtained by considering the impact to the portion within the 2-mile transmission line corridor against the total special management area or area available for general recreation. In some cases, visual and noise effects to the recreation setting may require a wider analysis area for the full characterization and impact analysis of those resources. Analysis areas for related resources are defined in the appropriate sections (Section 3.12, Visual Resources; Section 3.18.5, Noise) and are incorporated by reference in this section as applicable.

## 3.13.4 Baseline Description

Outdoor recreation opportunities on public lands in Wyoming, Colorado, Utah, and Nevada are a key factor that has attracted many people to the western U.S. The proximity of USFS, BLM, and other public lands to urbanized areas and rural communities is important to the quality of life for many residents and also is an important lifestyle factor in the increasing populations of many western communities. In addition, recreational use on public lands helps support the economies of western communities and states. The demand for outdoor recreation in the West has risen substantially, by 65 percent in the last 30 years (BLM undated). Recreation in the analysis area includes a broad range of developed and dispersed recreation opportunities on public and private lands.

## 3.13.4.1 Recreation Use Estimates and Trends

## BLM

The BLM provides annual public lands statistics (BLM 2011a) that include an overview of recreational use and opportunities on public lands. BLM offices are responsible for collecting and maintaining various data related to the recreation program. The field-level data are aggregated in the BLM's Recreation Management Information System (RMIS) database. **Table 3.13-2** summarizes estimated visitor use of BLM lands by state from 2000 to 2010.

Table 3.13-2 Estimated Recreation Use on BLM Lands by State, 2000 – 2010

		eloped tion Sites	Dispers	sed Areas		on Lease tes		eation ship Sites	To	otal

% change	-31.5%	72.3%	-36.3%	-58.9%					-32.9%	-33.9%

<sup>1</sup> A visit is the entry of any person for recreational purposes onto lands and related waters administered by the BLM, regardless of duration.

Sources: BLM 2001b, BLM 2011a.

Visits to both developed recreation sites and dispersed recreation areas on BLM-managed lands and waters have increased in Colorado and Nevada, while visits to BLM-developed recreation sites and dispersed recreation areas in Wyoming have decreased. Utah has experienced an increase in the use of BLM dispersed recreation areas, but a sharp decrease in use of developed recreation sites. Recreation lease sites and recreation partnership sites accounted for nearly a total of 1 million additional visits to BLM lands in all four states in 2010. Recreation visits on BLM lands in all four states increased by 7 percent between 2000 and 2010 (BLM 2011a). This has led to greater and more diverse forms of recreation use, as well as an increase in user conflicts and public concern over the most appropriate uses and management of the public lands. For all public lands, public demand for outdoor recreation, driven in part by a growing U.S. population and rising international visitation, continues to intensify; however, population increases in western states are not reflected in increasing visitation to BLM-managed lands in Utah and Wyoming. Other factors that may contribute to differing trends in recreation use estimates between the four states could include relative levels of disposable incomes, relative age of the population, or other demographic differences.

<sup>&</sup>lt;sup>2</sup> One visitor day represents an aggregate of 12 visitor hours at a site or area.

# **USFS**

The National Visitor Use Monitoring (NVUM) program provides estimates of the volume and characteristics of recreation visitation to NFS lands to help the USFS manage its recreation resources in a way that meets the needs of visitors while maintaining the quality of the natural resource base. The NVUM program conducts more than 100,000 visitor surveys on NFS lands every 5 years, with 20 percent of the national forests conducting surveys each year. This nationwide visitor use survey provides statistically sound estimates of visitation to each national forest and to each site type. The visitation data for the Ashley, Dixie, Fishlake, Manti-La Sal, and Uinta national forests, shown in **Table 3.13-3**, are from NVUM data collection completed from FY2002 through FY2011. Each forest gets sampled once every 5 years, so in a given year several forests are engaged in NVUM field data collection. Those forests that completed their NVUM work in 2009 were updating visitation estimates from approximately 5 years earlier. The NVUM data does not provide trend measures, but reports only the most current visitation patterns and activities on NFS lands. Data for 2002 and 2006 for some forests shown in **Table 3.13-3** were collected from forest plans and may not represent the same sampling methods.

Table 3.13-3 Estimated Recreation Use on National Forests Crossed by Analysis Area, 2002 to 2011

	Visits						
National Forest	2002	2006	2007	2008	2009	2010	2011
Ashley	1,338,428	N/A	960,000	N/A	N/A	N/A	N/A
Dixie	N/A	646,000	N/A	N/A	733,000	N/A	N/A
Fishlake	447,270	487,000	N/A	531,000	N/A	N/A	N/A
Manti-La Sal	804,301	672,000	N/A	N/A	N/A	N/A	352,000
Uinta*	2,840,000	N/A	2,934,000	N/A	N/A	N/A	N/A

N/A = not available.

Sources: USFS 2002 to 2011.

Based on the NVUM data, Uinta National Forest received the most visitation with about 3 million visits per year, with increased visitation between 2002 and 2007. The Ashley National Forest received between 900,000 and 1.4 million visits; current data show a decrease in visitation between 2002 and 2007. The Dixie and Manti-La Sal national forests generally received between 500,000 and 800,000 visits per year; current data show an increase in visitation to the Dixie National Forest, while visitation on the Manti-La Sal National Forest dropped each reporting year, with a drop to below 400,000 in 2011 (USFS 2002 to 2011). The Fishlake National Forest received the least visitation, with an average visitation of less than 500,000.

## 3.13.4.2 Recreation Opportunities

Recreation opportunities exist on all public lands within the analysis area. Recreation opportunities may be dispersed or developed:

Dispersed recreation opportunities include unstructured activities and typically occur in a more primitive setting. Dispersed, unstructured activities typify the recreational uses occurring on public (federal and state) lands throughout the majority of the analysis area. Dispersed recreation in the analysis area includes motorized and non-motorized activities such as undeveloped camping, fishing, hunting, hiking, horseback riding, rock and ice climbing, mountain biking, snowmobiling, caving, off-highway vehicle (OHV) trail riding or open area

<sup>\*</sup> Reported visitation is for just the Uinta National Forest portion of the Uinta-Wasatch-Cache National Forest. Only recreation resources within the Uinta National Forest, as identified in the Uinta National Forest LRMP, are within the analysis area. Therefore, all subsequent references to the Uinta-Wasatch-Cache National Forest will be only to the Uinta National Forest, which may differ from other resource sections.

use, and driving for pleasure. Dispersed recreation activities by Project region are included in Section 3.13.5, Regional Summary.

 Developed recreation sites on federal and state lands in the analysis area include campgrounds, picnic areas, information and interpretive sites, trailhead facilities, boat ramps, and fishing accesses. Federal agencies provide the majority of developed recreation facilities in the analysis area. City and county governments also provide public recreation facilities, consisting primarily of parks, trails, and open space areas. Privately owned recreation facilities in the analysis area include golf courses, private campgrounds, a hot springs, and facilities or services available through lodging providers. These facilities are listed by Project region in Section 3.13.5, Regional Summary.

Recreation opportunities also include special management areas designated by Federal agencies, including BLM special recreation management areas (SRMAs), historic trails, scenic byways, etc. Management of SRMAs focuses on providing special recreation opportunities that would not otherwise be available to the public, reducing conflicts among users, minimizing damage to resources, and reducing visitor health and safety problems. Recreation opportunities within or along these areas may be developed or dispersed. Recreation opportunities also are present on undesignated lands, which are those areas managed by a federal agency for which no special management exists.

Special Recreation Permits (SRP) are required for some recreation activities on BLM public lands. They are used to ensure public health and safety, protect recreation and natural resources, and ensure the public receives a fair monetary return for certain recreation uses of BLM public lands. SRPs are required for commercial activities, competitive events, certain organized group activities, and in some designated special areas. For NFS lands, Special Use Permits (SUPs) are issued for some recreational events.

## 3.13.4.3 Recreation Opportunity Spectrum Classes in the Analysis Area

The end product of recreation management is the experience people have, and the key to providing high quality recreation experiences and opportunities is the recreation setting and how it is managed. The Recreation Opportunity Spectrum (ROS) system is used by land managers to guide management of recreation settings and opportunities. ROS classifications may be incorporated into both BLM and USFS land use planning processes. The ROS provides levels of development, facility investment, and management intensity according to the different settings under each class. Typically, the ROS is divided into six or seven major classes described in **Table 3.13-4**. These classes include conditions that range from high-density urban environments to primitive settings. Physical, social, and managerial conditions will vary along this continuum. In general, the analysis area is located primarily along existing roadway and utility corridors that are characterized by the ROS classes Roaded Natural, Roaded Modified, or Rural.

Table 3.13-4 Recreational Opportunity Spectrum (ROS) Classifications

		Setting Description						
ROS Class	Sights and Sounds of Humans	Motorized Use/Parking	Area Characterization					
Urban	Predominant	Facilities for highly intensified motor use and parking are available	Large numbers of users can be expected, substantially urbanized environment although the background may have natural appearing elements					
Rural	Readily evident	Facilities for intensified motorized use and parking are available	Considerable number of facilities are designated for use by a large number of people, moderate densities are provided far away from developed sites and facilities, substantially modified natural environment					
Roaded Modified		•	Similar to the Roaded Natural setting, except this area has been heavily modified (roads or recreation facilities). This class still offers opportunity to have a high degree of interaction with the natural environment and to have moderate challenge and risk and to use					

Table 3.13-4 Recreational Opportunity Spectrum (ROS) Classifications

		Setting Description					
ROS Class	Sights and Sounds of Humans	Motorized Use/Parking	Area Characterization				
Roaded Natural	Moderate evidence	Conventional motorized use is provided for in construction standards and design of facilities	Interaction between users may be low to moderate, but with evidence of other users prevalent, predominantly natural appearing environment				
Semi-primitive Motorized	Often evidence of other users	Motorized use may be evident	Concentration of users is low, predominantly natural or natural- appearing environment				
Semi-primitive Non-motorized	Often evidence of other users	Public motorized use is not permitted	Interaction between users is low, predominantly natural or natural-appearing environment				
Primitive	Minimal evidence of other users	Motorized use is not permitted	Interaction between users is very low, essentially unmodified natural environment				

The Fishlake, Uinta, Ashley, and Manti-La Sal national forests all utilize ROS classes to manage recreation. Although the Dixie National Forest LRMP does not utilize ROS classes, it does include developed recreation, semi-primitive recreation, and roaded natural recreation classifications that relate closely to ROS classes. Currently, most BLM field offices in the analysis area include very limited, if any, implementation of ROS in the RMPs; however, the Rawlins Field Office uses a ROS system comprising Primitive, Front Country, and Middle Country designations to guide recreation decisions within the Adobe Town DRUA. These designations are roughly analogous to the primitive, semi-primitive motorized, and roaded natural ROS categories described above.

# 3.13.4.4 Special Recreation Management Areas

The BLM designates recreation management areas where recreation and visitor services objectives are recognized as a primary resource management consideration and specific management is required to protect the recreation opportunities. Such recreation management areas are designated as either a SRMA or an Extensive Recreation Management Area (ERMA). SRMAs recognize unique and distinctive recreation values and are managed to enhance a targeted set of activities, experiences, benefits, and recreation setting characteristics, which become the priority management focus. ERMAs recognize existing recreation use and demand, and are managed to sustain principal recreation activities and associated qualities and conditions of the ERMA, commensurate with management of other resources (BLM 2011b). In some BLM Field Offices, all recreation areas not located within a SRMA are considered an ERMA. Generally, recreation opportunities in ERMAs are dispersed, unstructured activities that do not require intensive management or substantial investment in trails or facilities.

There are no designated recreation management areas on NFS lands within the analysis area.

SRMAs or ERMAs within the analysis area are identified for each Project region in Section 3.13.5, Regional Summary.

# National Recreational Areas

NRAs are congressionally designated recreation areas, often centered on large reservoirs and emphasizing water-based recreation. Congressionally designated units of the NPS, including national recreation areas, and other similar Congressionally designated areas under the management of other agencies, have a higher level of national significance and protection than agency-designated land use classifications. Within the analysis area, the Lake Mead NRA is operated by the NPS and is located in southeastern Nevada and northwestern Arizona. The NRA encompasses two reservoirs (Lake Mead and Lake Mohave) formed by the Colorado River, which flows through Glen Canyon NRA and Grand Canyon National Park before reaching the Lake Mead NRA. The Lake Mead NRA contains 1,482,476

acres of federal land and 28,212 acres of nonfederal land. The Lake Mead NRA offers year-round recreational opportunities for boating, fishing, hiking, photography, picnicking and sightseeing. It also is home to thousands of desert plants and animals. A description of the portion of the Lake Mead NRA that is within the Region IV analysis area is included in Section 3.13.5, Regional Summary.

# National and State Scenic Byways and Backways

The National Scenic Byways (NSB) Program was established under the Intermodal Surface Transportation Efficiency Act of 1991 and reauthorized in 1998 under the Transportation Equity Act for the 21st Century. Under the program, the U.S. Secretary of Transportation recognizes certain roads as National Scenic Byways or All-American Roads based on their archaeological, cultural, historic, natural, recreational, and scenic qualities.

To be considered for designation within the National Scenic Byways Program, a road must possess characteristics of regional importance within at least one of the six intrinsic quality categories identified above. Roads designated as All-American Roads must possess at least two of these intrinsic qualities at a level of national importance. Backways and byways are components of the National Scenic Byway Program that meet the byway criteria, but generally do not meet full federal safety standards, meaning they are not wide enough, graded enough, or level enough to be safe year-round for passenger cars. States or federal agencies such as the BLM also may designate scenic byways or backways. In general, the terms National Scenic Byway; All-American Road State Scenic Byway; Indian Tribe Scenic Byway; or USFS-, BLM-, BIA-, or NPS-designated Scenic Byway and Backway refer not only to the road or highway itself, but also to the corridor through which it passes.

The analysis area contains a number of scenic byways and backways. These roads and their intrinsic qualities are identified for each Project region in Section 3.13.5, Regional Summary. Section 3.12, Visual Resources, also contains information about the important landscapes viewed from scenic byways.

# **Designated National Trails and Other Recreational Trails**

The National Trails System is a network of scenic, historic, and recreation trails created by the National Trails System Act of 1968 and amended in 1978 (NPS 2009).

- National recreation trails provide a variety of outdoor recreation uses in or reasonably accessible to urban areas.
- National scenic trail designation is extended to trails providing maximum outdoor recreation
  potential and conservation and enjoyment of the nationally significant scenic, historic, natural,
  or cultural qualities of the areas through which the trails may pass.
- National historic trail designation is extended to trails following as closely as possible and practicable to original trails or routes of travel of national historic significance.

There is one National Recreation Trail within the analysis area, the River Mountains Loop Trail, located near Las Vegas, Nevada. This 35-mile trail is a multi-use trail managed by the City of Henderson, Bureau of Reclamation, City of Boulder, and NPS. The River Mountains Loop Trail also is a National Millennium Trail. Impacts to this trail are discussed in Section 3.13.6.12, Region IV.

There is one National Scenic Trail that passes through the analysis area: the Continental Divide National Scenic Trail (CDNST). Impacts to this trail are discussed in Section 3.13.6.9, Region I.

The Old Spanish National Historic Trail crosses the analysis area at numerous locations in Utah and Nevada in Regions II, III, and IV. The Old Spanish Trail route was established along a network of Native American footpaths that crossed the expanse of the Colorado Plateau and the Mojave Desert. While there are public and private organizations offering interpretation and education, cultural

activities, and local heritage recreational events in some areas along the route (Old Spanish Trail Association 2011), the Old Spanish National Historical Trail is primarily a historic resource, not a recreational trail. Impacts to the Old Spanish National Historic Trail and other historic trails are therefore analyzed in Section 3.11, Cultural Resources and Native American Concerns, and Section 3.15, Special Designation Areas. However, it is unknown at this time if the segments of the historic trails/roads/highways crossed by the alternatives are contributing segments to these linear resources overall NRHP eligibility. Visual impacts to historic trails also are discussed in Section 3.12, Visual Resources.

# State Wildlife Management Areas, Cooperative Wildlife Management Units, and State Parks

The analysis area contains two Wyoming state WHMAs, three Colorado SWAs, one hunting lease, and 23 units within the Utah wildlife management area (WMA) system. These wildlife management areas have been established to preserve fish and wildlife habitat and to provide recreational opportunities including fishing, hunting, and wildlife viewing. TWE would need to apply to the managing entity for access to a permanent ROW within WMAs. Because WMAs are often acquired with Federal Aid funds to protect wildlife habitat, the USFWS-Fed Aid would need to make a determination on whether or not the proposed access and ROW would compromise the purposes for which the property was acquired before TWE's application would be approved. Similarly, three of the WMAs totaling 6,900 acres are managed as partial mitigation for the Central Utah Project. These properties are a mix of State of Utah (39 percent) and Federal (61 percent) ownership. The Mitigation Commission, in consultation with the USFWS, would need to make a determination on whether or not the proposed access would compromise the purposes for which the properties were acquired and the appropriate compensatory mitigation that would be required should a ROW be approved.

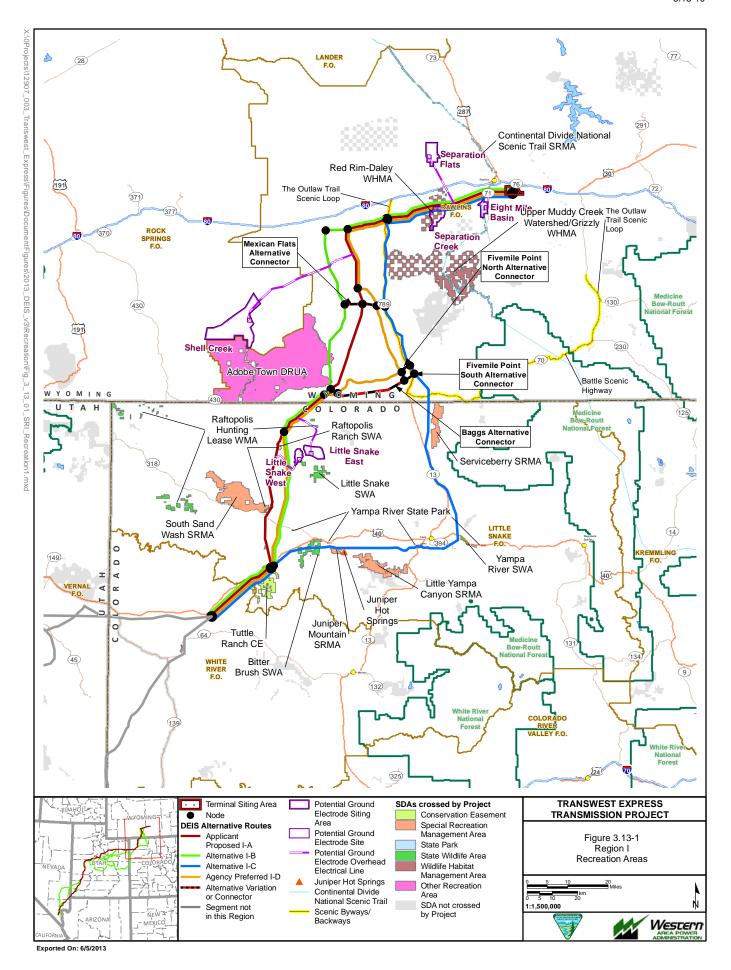

The analysis area also contains 15 cooperative wildlife management units (CWMUs) in Utah. These are hunting areas consisting of mostly private lands that have been authorized for the specific purpose of managing big game animals. CWMUs may have special management that would preclude development of roads or transmission lines. The analysis area also includes two state parks. WHMAs, SWAs, WMAs, CWMUs, and State Parks are described by Region in Section 3.15.3 and included in Figures 3.13-1 through 3.13-5.

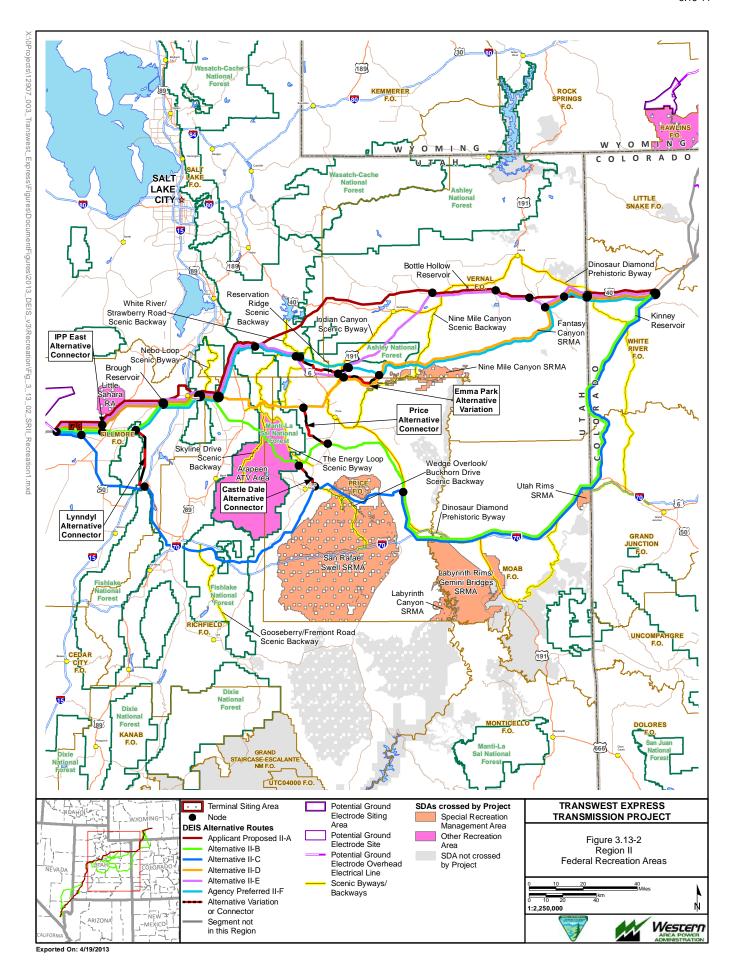

### Other Special Management Areas

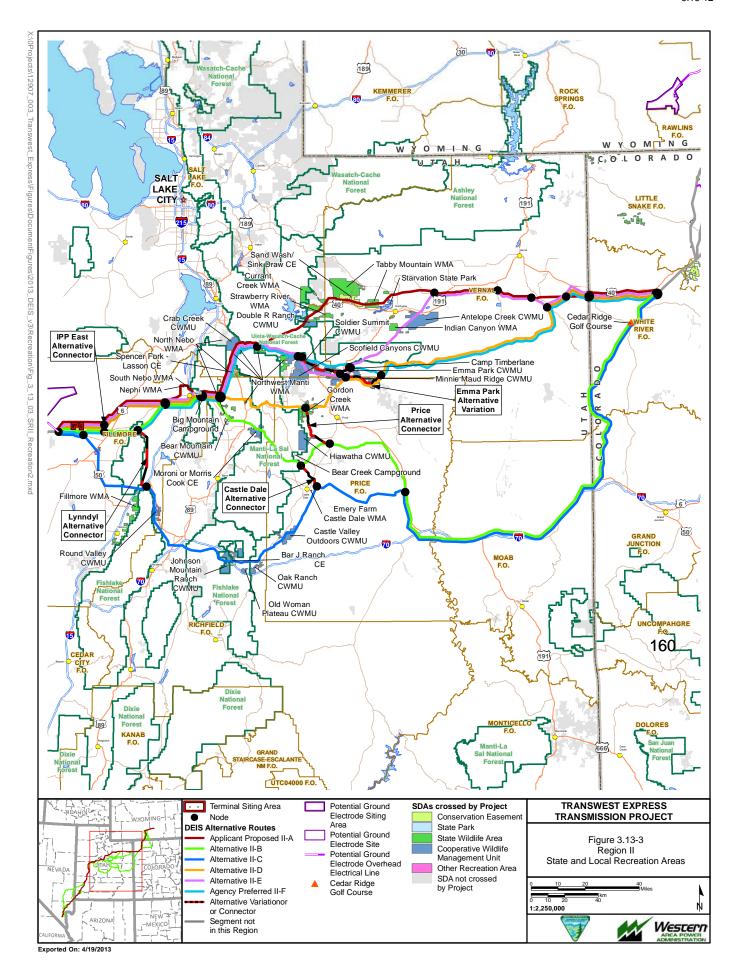

In addition to designated recreation areas, there are federally designated special management areas within the analysis area where recreation occurs, including wilderness areas, WSAs, roadless areas, national monuments, and ACECs. These areas generally provide opportunities for solitude and dispersed recreation activities in a primitive setting, but are not managed primarily for recreation. Wilderness areas, WSAs, ACECs, roadless areas, national monuments, and other special designation areas are described in more detail in Section 3.15, Special Designations.

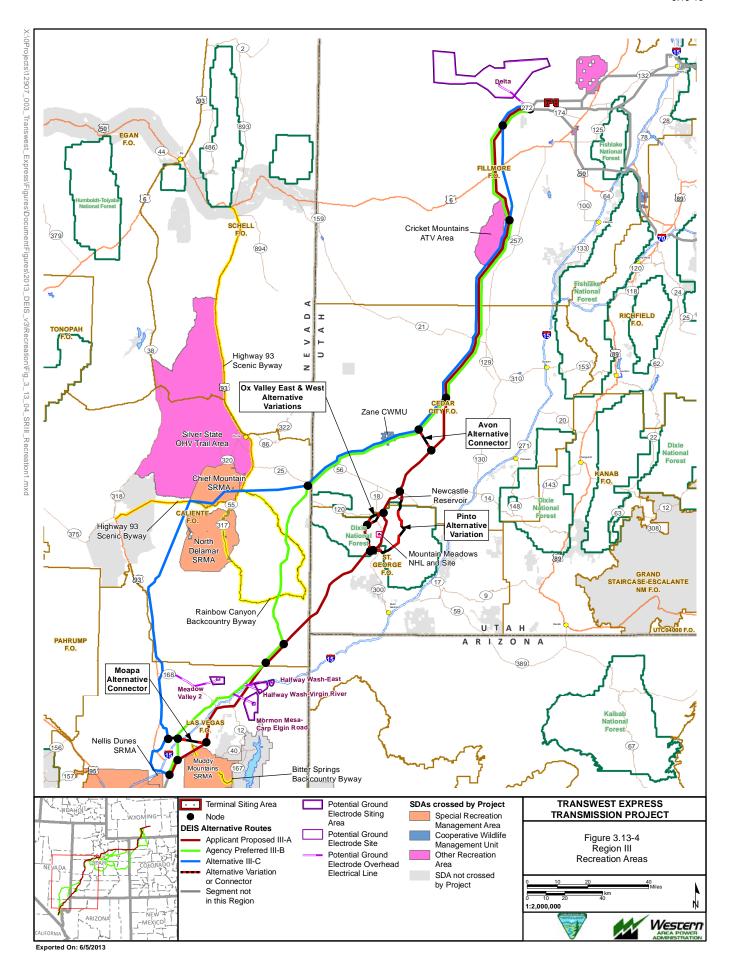

## 3.13.4.5 Off-Highway Vehicle Use on Dispersed and Specially Managed Recreation Areas

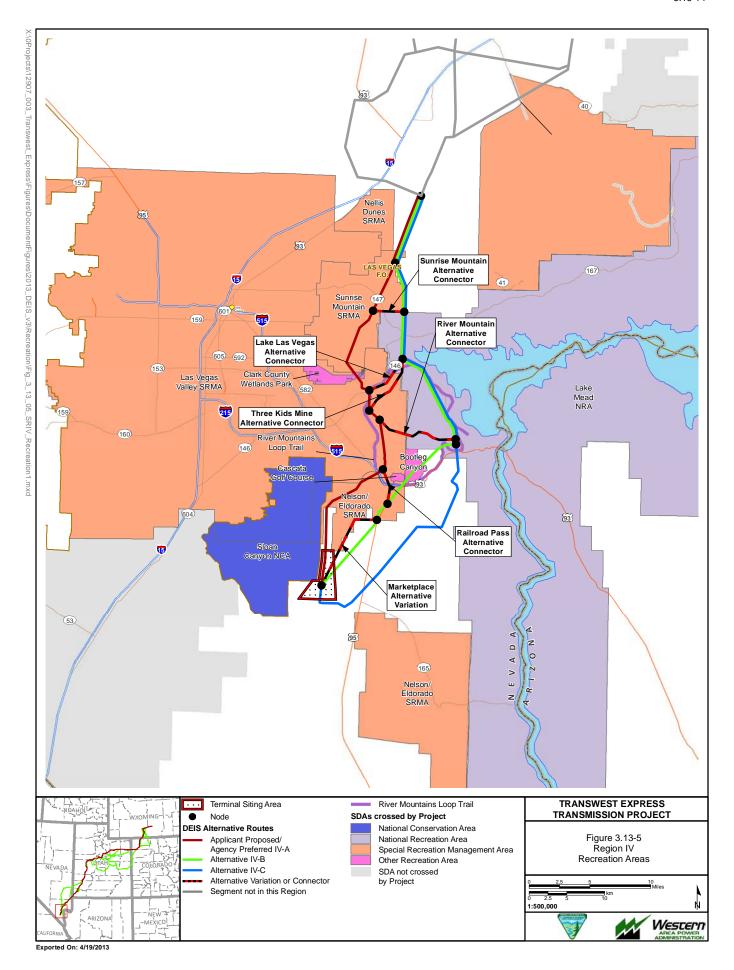

OHV use is one of the fastest growing recreational activities on public lands (USFS undated). Annual retail purchases of OHVs in the U.S. increased by 280 percent over a 10-year period from 368,600 OHVs in 1996 to 1,034,966 in 2006 (USFS 2006). OHV types used within the analysis area include all-terrain vehicles (ATV), cars/trucks/sport utility vehicles (SUV), motorcycles, and snowmobiles, though the majority of OHV participants in the analysis area use cars/trucks/SUVs. In addition to riding OHVs as a recreation activity, OHVs provide transport for non-recreation public uses such as grazing, oil and gas development, and other authorized uses of public lands (see Section 3.14, Land Use), as well as transport for recreation opportunities such as hunting, fishing, and camping. OHV use occurs both on-and off roads and trails as designated by federal agencies that manage land in the analysis area.

Increasing OHV traffic on public lands has caused the uncontrolled proliferation of user-created, undesignated trails arising from repeated cross-country travel. Unauthorized motorized use causes natural resource damage (e.g., soils, habitat) and increased public safety concerns (USFS undated). In 1972, Executive Order No. 11644 was issued, requiring each federal agency to designate "areas and trails" for off-road vehicle use or restriction, and to develop regulations to implement the Executive Order (BLM 2001a). The BLM's regulations (43 CFR 8340) established management areas as either "open," "limited," or "closed" to off-road vehicle use.

- Open: an area where all types of vehicle use is permitted at all times, anywhere in the area subject to the operating regulations and vehicle standards. The BLM designates areas as "open" for intensive off-road vehicle (ORV) use where there are no compelling resource protection needs, user conflicts, or public safety issues to warrant limiting cross-country travel.
- Limited: an area restricted at certain times, in certain areas, and/or to certain vehicular use. These restrictions may be of any type, but can generally be accommodated within the following type of categories: numbers of vehicles; types of vehicles; time or season of vehicle use; permitted or licensed use only; use on existing roads and trails; use on designated roads and trails; and other restrictions. The agency designates areas as "limited" where it must restrict ORV use in order to meet specific resource management objectives. The BLM also may enact other limitations to protect resources, particularly in areas that motorized OHV enthusiasts use intensively or where they participate in competitive events.
- Closed: an area where ORV use is prohibited. The BLM designates areas as "closed" if
  closure to all vehicular use is necessary to protect resources, ensure visitor safety, or reduce
  use conflicts.

The BLM's OHV designations are determined through the land use planning process. A summary of OHV designations within the analysis area is included in the regional summaries contained in Section 3.13.5.

For lands within the NFS, each national forest or ranger district designates roads, trails, and areas as open or closed to motor vehicles. In general, OHV use within national forests is limited to existing or designated roads and trails. NFS road and trail designations include class of vehicle and, if appropriate, time of year for motor vehicle use. USFS travel designations are required to be shown on a motor vehicle use map (USFS 2011). Outside of BLM and USFS lands, some OHV use is allowed. A summary of OHV designations by agency is included in the regional summaries contained in Section 3.13.5, Regional Summary of Recreation Sites/Areas.

# 3.13.5 Regional Summary of Recreation Sites/Areas

Summaries of dispersed and developed recreation opportunities and special designated management areas are provided by Project Region in the sections below.

## 3.13.5.1 Region I

Within Region I, three BLM FOs provide a variety of recreation opportunities in Wyoming and Colorado: Rawlins, Little Snake, and White River. Recreation opportunities available on lands within the analysis area generally include hunting, fishing, geocaching, wildlife viewing, boating, hiking, mountain biking, horseback riding, rock hounding, camping, OHV use, and picnicking. BLM recreation lands contain almost no developed facilities. There are no USFS lands within the Region I analysis area. There is one NPS-managed national monument in the Region I analysis area (also discussed in Section 3.15, Special Designations). A brief description of dispersed recreation activities by BLM FO is included in **Table 3.13-5**. **Table 3.13-6** identifies all federally managed special recreation management areas within the Region I analysis area. There are no designated scenic byways and backways within the analysis area. **Figure 3.13-1** identifies all recreation areas within the Region I analysis area.

Table 3.13-5 Federally Managed Dispersed Recreation Opportunities within Region I Analysis Area

Managing Entity	Key Dispersed Recreation Activities within Analysis Area
BLM Rawlins FO, Wyoming	The FO encompasses approximately 3.5 million acres of BLM-managed public lands. Dispersed recreation activities on public lands include wildlife viewing, hunting, hiking, backpacking, OHV use, fishing, biking, photography, camping, orienteering, and floating. Access to public lands is limited due to the checkerboard pattern of land ownership. Access for dispersed recreation occurs through Carbon County roads and BLM roads, the CDNST (discussed below), the North Platte River, and across public lands. Hunting occurs on federal land sections that are accessible by public roads or with permission of the private landowner. OHV use is limited to existing roads and vehicle routes within the checkerboard area and limited to designated roads and trails between the checkerboard area and the state line. The analysis area includes portions of the 238,970-acre Adobe Town Dispersed Recreation Use Area, which is managed to provide dispersed recreation in an undeveloped recreation setting. The Rim Lake recreation site, a small day use and fishing area, also is located within the analysis area. The analysis area also includes portions of the Battle Scenic Highway and Outlaw Trail Scenic Loop, which are not designated national scenic byways, but are recommended recreational driving routes.
BLM Little Snake FO, Colorado	The FO encompasses approximately 1,336,900 acres of BLM-managed public lands. Dispersed recreation activities on public lands include hunting, fishing, geocaching, wildlife viewing, boating, hiking, mountain biking, horseback riding, rock hounding, camping, OHV use, and picnicking. Hunting is a popular recreation activity. The area west of Craig/Maybell is excellent for pronghorn antelope hunting. OHV use is limited to existing roads and trails pending transportation planning; the Juniper Mountain SRMA is limited to designated roads and trails. The Yampa River is very popular for fishing, boating and floating, especially on weekends. The Yampa River is one of the most hydrologically and biologically intact rivers in the West. The portion of the Yampa River between Craig and Maybell receives intensive recreation use and is renowned for its high quality scenery and recreation opportunities. The area contains several special management areas (discussed below). Equestrian activities on public lands in the Little Snake Resource Area generally occur on existing roads and trails or open country areas. Popular equestrian areas exist in the South Sand Wash and Little Yampa Canyon SRMAs (discussed below).
BLM White River FO, Colorado	The FO encompasses 1.5 million acres of BLM-managed public lands. Dispersed recreation activities are available in the analysis area.

Sources: BLM 2012a,b,c,d; 2011c; 2008a; 1987a; Public Lands Information Center 2013.

Table 3.13-6 Federally Managed Special Recreation Management Areas within Region I Analysis Area

Managing Entity	Recreation Site/Area <sup>1</sup>	Description
BLM Rawlins FO, Wyoming	CDNST SRMA	600-acre SRMA containing about 82 miles of trail. Recreation activities on the trail include hiking, mountain biking, horseback riding, and limited motor vehicle use. The 3,100-mile CDNST runs along the Rocky Mountains from Canada to Mexico and is managed to provide high quality primitive hiking and horseback riding opportunities in diverse country along the trail, and to conserve natural, historic, and cultural resources along the trail corridor (USFS 2009a). Within the SRMA, the BLM Rawlins FO manages the trail to emphasize interpretive and educational opportunities and to ensure the continued availability of outdoor recreation opportunities associated with the trail. Recreation activities within the SRMA include backpacking, mountain biking, camping, hunting, OHV use, picnicking, and wildlife viewing. The SRMA is an avoidance area for linear utility systems.

Table 3.13-6 Federally Managed Special Recreation Management Areas within Region I Analysis Area

Managing Entity	Recreation Site/Area <sup>1</sup>	Description
BLM Little Snake FO, Colorado	South Sand Wash SRMA	35,510 acres. Recreation activities in the SRMA include wildlife viewing, hunting, rock hounding, mountain biking, camping, antler gathering, and OHV use. Zone 1: open off-road motorized recreation. Zone 2: single-track and double-track OHV riding, limited to designated roads and trails. Physical, social, and administrative prescribed setting character is rural; near improved country roads and a highway, large groups and conspicuous and large-scale landscape alteration.
	Juniper Mountain SRMA	1,780 acres. Recreation activities in the SRMA include boating, hunting, camping, and hiking. ROW avoidance area. Zone 1: Day use motorized and non-motorized boating. Zone 2: Hunting (national- and regional-level destination big game hunting), camping, hiking, and horseback riding. The physical setting character is natural landscape with some primitive and maintained roads and trails. The social and administrative setting is backcountry, where encounters with other people will be from 3 to 6 people and landscape alterations are uncommon.
	Serviceberry SRMA	12,375 acres. Zone 1: Non-motorized hunting and heritage interpretation/education. Zone 2: Non-motorized big game hunting and undeveloped camping in a backcountry setting.
	Little Yampa Canyon SRMA	27,310 acres. Managed to provide river boating, big game hunting, camping, wildlife viewing, and interpretation/education opportunities for local communities and visitors to the area. VRM Class II for areas within line of sight from the river within the SRMA; VRM Class III elsewhere.
	Yampa Valley Trail	100-mile motorized and non-motorized trail along the Yampa River. Recreation uses on the trail include mountain biking, horseback riding, hiking, wildlife viewing, and OHV use. Includes the East and West Juniper Mountain trailheads.
NPS	Dinosaur National Monument	Dinosaur National Monument consists of 209,444 acres and offers a variety of recreation opportunities, including river rafting on the Green and Yampa Rivers, scenic driving, stargazing, hiking, bicycling, camping, fishing, horseback riding, snowmobiling, snowshoeing, cross-country skiing, and fossil viewing. The monument also offers guided tours.

<sup>&</sup>lt;sup>1</sup>Within each BLM FO, other specially designated areas, such as WSAs, WSRs, wilderness areas, or ACECs have recreational use, but are not designated specifically for recreational use. These other areas are analyzed in Section 3.15, Special Designations.

Sources: BLM 2012a,b,c,d, 2011c, 2008a, 1987a; NPS 2013b.

Within the Wyoming portion of the analysis area, Wyoming Game and Fish manages two WHMAs within the region primarily for hunting. Within the Colorado portion of the analysis area, CPW manages one state park, which includes several popular recreation access points along the Yampa River; three SWAs; and portions of State Trust lands that are part of the Public Access Program and are available for hunting, wildlife viewing, and fishing. One private recreation site also is located in Region I, Juniper Hot Springs. **Table 3.13-7** provides a list of all state managed recreation areas within the analysis area, including key resource values and recreation activities.

Table 3.13-7 State and Locally Managed Recreation Areas within Region I Analysis Area

Managing Entity	Management Area	Description	
, ,	WHMA	25,177 acres. Provides crucial winter habitat for pronghorn antelope and a variety of other wildlife.  Open all year, however, drifting snow closes most trails in early winter. Recreation activities include hunting (elk, deer, antelope, moose, and upland game birds), camping, hiking, and wildlife viewing.	

Table 3.13-7 State and Locally Managed Recreation Areas within Region I Analysis Area

Managing Entity	Management Area	Description			
Wyoming Game and Fish (Continued)	Upper Muddy Creek Watershed/Grizzly WHMA	59,783 acres. Utility ROW avoidance area. Managed for Colorado River fish species unique to the Muddy Creek watershed and for crucial winter habitat for elk and mule deer. Motorized vehicle use limited to designated roads and vehicle routes. Surface disturbing activities buffers exist around aquatic resources.			
Colorado Parks and Wildlife	Bitter Brush SWA	8,057 acres. Recreation activities include hunting (deer, elk, and pronghorn) and wildlife viewing. Public access is prohibited from January 15 through April 30. Vehicle access is restricted to Moffat County Roads 59 and 143.			
	Little Snake SWA	5,501 acres. Recreation activities include hunting, camping, hiking, and wildlife viewing.			
	Yampa River SWA	860 acres. Recreation activities include northern pike fishing, waterfowl hunting, wildlife-watching, and boating. Area includes put-in and take-out access point for boaters.			
	Raftopolous Hunting Lease	11,383 acres. CDOW conservation easement on private lands for hunting use.			
	Yampa River State Park	Park comprises a 134-mile-long portion of the river, stretching from Hayden, Colorado to Dinosaur National Monument on the Utah border. There are 13 river access points, six of which are within the analysis area (from east to west):			
		Yampa River SWA (see above)			
		<ul> <li>South Beach (Pump Station) Access Point: 3 miles south of Craig. Offers fishing, camping, and boat launching. Access from this point offers an opportunity to float into "Little Yampa Canyon," a 32-mile stretch of river to the next access point.</li> </ul>			
		Juniper Mountain Access Point: 20 miles west of Craig. Offers camping, picnicking, fishing, boat launching, and wildlife viewing.			
		Maybell Bridge Access Point: In Maybell. Improved site, offers picnic sites and overnight camping.			
		Sunbeam Access Point: 7 miles northwest of Maybell. Primarily for boat launching; minimal facilities and no overnight camping.			
		East Cross Mountain Access Point: 18 miles southwest of Maybell. Improved site, camping permitted.			
Private	Juniper Hot Springs	Located south of Maybell, Colorado. Several mineral spring pools are available and camping is allowed.

# 3.13.5.2 Region II

Recreation opportunities within this region are provided by a variety of entities, including eight BLM FOs, four national forests, the Utah Division of Wildlife Resources, the Utah Division of State Parks and Recreation, one county, one tribe, and several private entities/associations. Recreation opportunities on lands within the analysis area include: OHV use, fishing, boating, camping, picnicking, hunting, hiking, horseback riding, mountain biking, scenic driving, and wildlife viewing. Only a few recreation sites within the region contain developed facilities. The region includes 17 WMAs/units in Utah that primarily provide hunting and wildlife viewing opportunities. In addition, the Utah Cooperative Wildlife Management Association manages 14 hunting units in the region. Emery County, the Church of Jesus Christ of Latter-Day Saints, and a private company operate three campgrounds within the region. Brief descriptions of dispersed and developed recreation opportunities by BLM FO and national forest are included in **Tables 3.13-8** and **3.13-9**. **Table 3.13-10** identifies scenic byways and BLM backways within the Region II analysis area. **Table 3.13-11** identifies all

federally managed special recreation management areas within the Region II analysis area, and **Table 3.13-12** identifies all state and locally managed recreation areas within the Region II analysis area. **Figure 3.13-2** identifies all federally managed recreation areas within the Region II analysis area. **Figure 3.13-3** identifies all state and locally managed recreation areas within the Region II analysis area.

Table 3.13-8 BLM-Managed Recreation Opportunities within Region II Analysis Area

Managing Entity	Key Recreation Activities within Analysis Area
White River FO, Colorado	1.5 million acres of BLM-managed public lands. Recreation activities available in the analysis area include fishing and boating on the White River, and at Kinney Reservoir, as well as big game and mountain lion hunting, rock crawling, scenic driving, cultural tourism, and OHV use.
Grand Junction FO, Colorado	1,280,000 acres of BLM-managed public lands. Recreation activities in the north desert area include motorized uses, including an open OHV use area, hunting, and recreational shooting. Within the Book Cliff area, recreation activities include wild horse viewing, hiking, and horseback riding.
Moab FO, Utah	1.8 million acres of BLM-managed public lands, which are a destination recreation area with two million annual site visits. Recreation activities support hundreds of local jobs and the bulk of the local business community. Recreation opportunities include mountain biking; dirt bike, OHV and jeep use; rock climbing; river rafting; casual sightseeing; and hiking. The FO experiences a high number of seasonal visitors and an intense demand for recreational activities. Busy seasons include both spring and fall, with spring bringing the most visitors to the area. Summer visitation is mainly associated with touring the nearby National Parks and with river-related activities.
Vernal FO, Utah	1,697,039 acres of BLM-managed public lands. Recreation opportunities within the FO area include bird watching, camping, fishing, hiking, river running on the Green River, hunting, mountain biking, recreational driving, OHV use, and historical tourism. The analysis area contains a portion of the Dinosaur Diamond Prehistoric Byway.
Price FO, Utah	2,479,000 acres of BLM-managed public lands. Recreation activities include camping, hunting, fishing, hiking, horseback riding, rock climbing, mountain biking, caving, river running, wildlife viewing, visiting historic sites, sailing, OHV use, and fishing and boating on the Green River, Price River, and San Rafael River. Historical tourism is available at dinosaur quarries and provides examples of prehistoric Fremont Culture. Key recreational areas include the San Rafael Swell, which is 2,000 square miles of public land known for its scenic sandstone formations, deep canyons, desert streams, and expansive panoramas. The analysis area contains a portion of the Energy Loop: Huntington/Eccles Canyons Scenic Byway, the Wedge Overlook/Buckhorn Drive Scenic Backway, and the Nine Mile Canyon Scenic Backway.
Richfield FO, Utah	2.1 million acres of BLM-managed public lands. Recreation activities include bird watching, camping, hiking, OHV activities, horseback riding, whitewater boating, and recreational driving. Recreational opportunities are generally dispersed and without constructed facilities.
Salt Lake FO, Utah	2 million acres of BLM-managed public lands. Recreation opportunities in the analysis area include camping, scenic backcountry driving, OHV use, hiking, horseback riding, hunting, mountain biking, rock climbing, wilderness backpacking, wildlife viewing, nature photography, rock hounding, and geocaching.
Fillmore FO, Utah	4.7 million acres of BLM-managed public lands located on the eastern edge of the Basin and Range Geographic Province. Portions of the FO are in both Region II and Region III. Dispersed recreation opportunities within the Region II portions of the FO include hunting, fishing, hiking, round hounding, and OHV use, including 60,000 acres of sand dune riding in the Little Sahara Recreation Area.

Table 3.13-10 Scenic Byways and BLM Backways within Region II Analysis Area

Name	Length/Designation	Description
Dinosaur Diamond Prehistoric Byway	480-mile National Scenic Byway within western Colorado and eastern Utah	The route passes by numerous sites where dinosaur bones and tracks are visible in the ground. There are many museums along the route that provide opportunities to see and learn about dinosaurs.
The Energy Loop/Huntington- Eccles Canyons Scenic Byway	83-mile National/Utah/National Forest Scenic Byway between Huntington, Fairview, and Colton primarily through the Manti-La Sal National Forest	Passes by historical industrial development resources including coal mining operations, historic mining towns, and coal-fired power plants. Nearby Sanpete Valley contains some of the best-preserved Mormon Pioneer settlements in existence.
Indian Canyon Scenic Byway	47-mile National/Utah State Scenic Byway crossing the Ashley National Forest between Helper and Duchesne	Passes by a unique display of rock formations and vegetation types, from pinyon and juniper to aspen and Douglas fir. Elk and deer are often seen along the route and the contrasts of autumn foliage are particularly beautiful. From the summit, the road follows Indian Canyon through desert terrain bordering Indian Creek. Offers access to recreation areas within the Ashley National Forest. This route is a portion of the Dinosaur Diamond Prehistoric Highway.
Reservation Ridge Scenic Backway	45-mile Utah/National Forest Backway between Soldier Summit on Highway 6 to U.S. 191	The route roughly parallels the Right Fork of the White River at first, as it climbs up to 8,900 feet, offering dramatic views of Strawberry Reservoir, then curving south through aspen and pine stands perched on top of the plateau, where openings provide more views of rugged cliffs and steep canyons.
Gooseberry/Fremont Road Scenic Backway	40-mile Utah Scenic Backway between Fremont, Utah, and Salina, Utah	Route travels through the Fishlake National Forest through mountain meadows cut by streams, offering recreation opportunities at Johnson Valley Reservoir, Lost Creek Reservoir, Rex Creek Reservoir, Sevenmile Creek, and the Gooseberry Ranger Station.
Wedge Overlook/ Buckhorn Drive Scenic Backway	Utah Scenic Backway; 20-mile and 25 mile segments located northeast of Castle Dale, along the San Rafael River	Vantage points along the rim of the San Rafael Swell provide views down canyon after canyon. Wedge Overlook offers a view down the "Little Grand Canyon," where the San Rafael River winds 1,200 feet below. Buckhorn Draw Road slowly descends through a narrow sandstone canyon, intersecting the river at points, and then reaching the interstate through open rangeland.

Table 3.13-10 Scenic Byways and BLM Backways within Region II Analysis Area

Name	Length/Designation	Description
Nine Mile Canyon Scenic Backway	78-mile National Backcountry Byway/Utah Scenic Backway between Price, Utah, and Myton, Utah	Passes through a major representative area of the prehistoric Fremont Culture. The canyon houses a myriad of rock panels along the main road and in side canyons. Petroglyphs (carvings on rock faces) and pictographs (paintings on rock faces) depict animals, hunting scenes, and godlike figures. Cliff granaries on high canyon ledges may be spotted by careful observers. Vegetation and terrain along this backway vary from high desert species to aspen groves. The buff colored cliffs of the canyon are highlighted by balanced rocks and window arches. Deer and elk are seen frequently. A number of side canyons branch off Nine Mile Canyon itself; rock art sites are frequently located near those junctions.
Skyline Drive Scenic Backway	86-mile Utah Scenic Backway between the Highway 6 Tucker rest stop along I-70 through the Manti-La Sal National Forest	Mountain road that follows the spine of the Wasatch Plateau climbing to an elevation of 11,000 feet and offering panoramic views of Sanpete Valley, mile-deep canyons, lake-filled basins and alpine meadows and forests. The route is accessible July through September. High clearance 4-wheel drive vehicles are required. The Skyline Drive corridor contains portions of the Great Western Trail.
White River/Strawberry Road Scenic Backway	28-mile Utah Scenic Backway between Soldier Summit on Highway 6 and Strawberry Reservoir	The road travels along the Left Fork of the White River, ascending 1,100 feet through the open fields of sage and grass, with stands of pine and aspen at higher elevations. At the terminus of the road is Strawberry Reservoir and Strawberry Bay, which are both fully developed for boating, fishing, camping, and picnicking.
Nebo Loop Scenic Byway	37-mile National Scenic Byway in Utah crossing the Uinta National Forest between the cities of Nephi and Payson	Route provides views of the Wasatch Range and 11,929-foot Mt. Nebo. Flat bottomlands, high-alpine conifers, red rock formations, gray sandstone cliffs and salt flats. Sites visible from the route include Devil's Kitchen, Walk Flat, and Mt. Nebo Wilderness.

Table 3.13-11 Federally Managed Special Recreation Management Areas within Region II Analysis Area

Managing Entity	Recreation Site/Area <sup>1</sup>	Description
BLM Moab FO, Utah	Utah Rims SRMA	15,424 acres. Managed as a Community SRMA to provide sustainable opportunities for motorized, mechanized, and non-motorized route-related recreation while protecting and maintaining other resource values. Includes the Bitter Creek campsite.
	Labyrinth Rims/Gemini Bridges SRMA	300,650 acres. Managed as a Destination SRMA to provide opportunities for boating, camping, mountain biking, OHV and jeep use, and scenic driving.
BLM Vernal FO,	Fantasy Canyon SRMA	69 acres. Provides opportunities for self-guided touring and hiking around unique geological formations.
Utah	Nine Mile Canyon SRMA	44,168 acres. Managed to protect high-value cultural values and scenic quality and provide cultural tourism opportunities within the canyon, which has the greatest abundance of well-preserved rock art in the west and is often referred to as the "world's longest art gallery."
BLM Price FO, Utah	San Rafael Swell SRMA	938,500 acres. Provides opportunities for sightseeing, OHV use, mountain biking, horseback riding, hiking, wildlife viewing, visiting cultural sites, camping, picnicking, photography, rock hounding, snowmobiling, and hunting.
	Labyrinth Canyon SRMA	34,240 acres. Managed to provide flatwater river recreation, camping, hiking, and rock art viewing opportunities.
BLM Fillmore FO, Utah	Little Sahara RA	60,000 acres. Area provides sand dune OHV riding and camping opportunities. The entire RA is open to OHV use except for campgrounds, where OHV use is limited to designated roads, and within the 9,604-acre Rockwell Natural Area, which is closed to OHVs.

<sup>&</sup>lt;sup>1</sup>Within each BLM FO, other specially designated areas, such as WSAs, WSRs, wilderness areas, or ACECs have recreational use, but are not designated specifically for recreational use. These other areas are analyzed in Section 3.15, Special Designations.

Sources: BLM 2012d,e,f,g,h,i,j,k; 2008b,c,d,e; 1997b; 1990; 1987a,b,c.

Table 3.13-12 State Managed and Locally Managed Recreation Areas within Region II Analysis Area

Managing Entity	Management Area	Description
Utah Division of State Parks and Recreation	Starvation State Park and Reservoir	State Park includes the reservoir and developed campground area. Boating, water skiing, wake boarding, and other sports are popular at Starvation Reservoir. The reservoir offers sandy beaches and fishing for walleye, trout, and perch.
UDWR	Gordon Creek WMA	22,690 acres (11,100 DWR, 6,900 BLM, 3,000 SITLA, and 1,690 private). Developed to assure protection of critical big game winter range. Reversionary clause on some parcels if land use changed from "big game management."
	North Nebo WMA— Fountain Green Unit	Three subunits: Fountain Green (365 acres), Moroni Conservation Easement (1,110 acres), and Big Hollow (850 acres). All units protect big game winter range; the Fountain Green unit is managed to reduce crop depredation on adjacent farms and improve upland game habitat. The property is closed to public access in winter and spring to protect wintering wildlife; the Fountain Green unit farm road is closed all year. Already crossed by power line(s).
		The Moroni Conservation Easement was purchased under three transactions, so there are three parts to the Conservation Agreement. The July 1997 agreement (#2-5249) states in Section B.2. Development Rights: Grantors convey to Grantee the rights to all industrial, commercial or any other forms of development that could be construed as inconsistent with the wildlife-habitat protection purpose of this Deed of Conservation Easement. Also in D.2. Easements and ROW: Without prior written approval of Grantee (UDWR), no rights-of-way or easements may be issued on the above-described property. In Parts II and III, section B.2. the Grantor conveyed the same development rights to the Grantee and the same terms and conditions for easements and ROWs as in the 1997 agreement.
	Currant Creek/Wildcat WMA	22,857 acres. Acquired as mitigation for wildlife habitat lost during construction of Central Utah Project (CUP) water developments. The property also provides angler access and aquatic/terrestrial habitat protection. Vehicle use during winter is not encouraged; motorized vehicles not allowed off remaining roads.
	Northwest Manti WMA– Dairy Fork Unit	4,975 acres. Unit acquired to preserve and enhance deer and elk winter range. Closed to public access in winter and spring to protect wintering wildlife. The WMA contains existing power lines.
	Northwest Manti WMA- Birdseye/Lake Fork Unit	3,750 acres. Unit acquired to preserve big game winter range. Closed to public access in winter and spring to protect wintering wildlife. The WMA contains existing power lines.
	Nephi WMA-Nephi Unit	152 acres. Unit supports riparian habitat and patches of emergent marsh along West Creek. Upland game hunting opportunities are available. Vehicles are not permitted on the property.
	Fillmore WMA	Several separate parcels covering 13,100 acres. Area managed to provide protection for big game winter range. All lands are fenced; vehicles are restricted to established roads. Closed to public access in winter and spring to protect wintering wildlife.
	Indian Canyon WMA – Cottonwood Canyon Unit	7,746 acres. Area provides opportunities to view elk, antelope, and small numbers of deer. Cottontail rabbit hunting is a popular wintertime activity in the Cottonwood Canyon area. Some roads are closed; motorized vehicles are not allowed off remaining roads. Vehicle use in winter is not encouraged.
	Tabby Mountain WMA– Rabbit Gulch Unit	Two parcels of 8,247 and 1,160 acres. Unit acts as critical range for big game in winter. Closed to public access in winter and spring to protect wintering wildlife. Vehicle use is confined to established roads.
	Tabby Mountain WMA– Tabby Mountain Unit	42,025 acres. Unit acts as critical range for big game in winter. Closed to public access in winter and spring to protect wintering wildlife. Vehicle use is confined to established roads. This WMA is adjoined by a conservation easement (Sand Wash/Sink Draw) that prohibits overhead transmission lines.
	North Nebo WMA– Spencer Fork Unit	6,500 acres. Unit acquired to protect big game winter range. Closed to all access in late winter and spring to protect wintering wildlife. Vehicle use is confined to established roads. Contains existing power line(s). Section B.2.a. of the 1999 Deed of Conservation Agreement (DCA) (#73398) states that the "Grantor conveysindustrial, commercial and any other forms of development that would be construed as inconsistent with the conservation values and purpose of the Easement" Section C.3. of the DCA states that: "Without prior written approval of Grantee, no rights-of-way or easement may be issued on the above described property."
	South Nebo WMA- Triangle Ranch Unit	4,918 acres. Unit managed to protect big game winter range. Closed to public access in winter and spring to protect wintering wildlife. Already crossed by power line(s). Reversionary clause on some parcels if land use changed from "big game management."

Table 3.13-12 State Managed and Locally Managed Recreation Areas within Region II Analysis Area

Managing Entity	Management Area	Description
UDWR (Continued)	Strawberry River WMA	3,070 acres. Area is mitigation for the CUP and provides unique fishing and wildlife viewing opportunities. Area contains big game and predator habitat. Vehicles are restricted to the main road and immediate parking areas. In accordance with the Mitigation Commission's and Bureau of Reclamation's management plan for the Strawberry River WMA, the middle Strawberry River from Soldier Creek Dam to about 1 mile upstream of Strawberry Pinnacles is one of the few remaining undeveloped riparian ecosystems in the region. The primary management objectives on this section of the middle Strawberry River are to provide the highest level of protection to the biological productivity and diversity of the riparian and aquatic ecosystem and to provide angling opportunities.
	Emery Farm Castle Dale WMA	80-acre farm comprised of salt-grass pasture and Russian olive trees. The property was obtained when the Emery County power plants were built to offer upland game habitat protection.
	Northwest Manti WMA– Hilltop Conservation Easement	1,074 acres. Unit includes juniper/pinyon woodlands interspersed with openings dominated by oakbrush or big sagebrush. The unit was acquired to protect and enhance high-value mule deer winter range. Closed to public access in winter and spring to protect wintering wildlife. Deed of Conservation Easement, Section V-Prohibited Uses and Practices, G. Construction (grantors will not construct any structures or facilities on the property); H. Roads (grantors will not construct any new roads except as specifically provided for in Section III), L. Utilities (additional utility structures and systems are prohibited, unless such structures or systems are necessary for permitted ranching operations or residential use)
	Northwest Manti WMA– Lasson Draw Unit	2,225 acres. Unit acquired to protect big game winter range. Comprised of a sagebrush/grass community in the valley and a pinyon juniper woodland/oakbrush community on the steeper slopes. Big game hunting and deer and elk viewing opportunities are provided. Property is closed to all access in late winter and spring to protect wintering wildlife. Motor vehicle use restrictions are enforced on the unit. Already crossed by buried pipeline; Questar pipeline maintenance road is not a public access road.
	Northwest Manti WMA– Starvation Unit	5,770 acres. Unit provides big game hunting opportunities and is a popular use of the property. Starvation Creek supports a limited fishery that receives a fair amount of fishing pressure. The unit was acquired to protect and enhance deer and elk winter range. The property is closed to public access in winter and spring to protect wintering wildlife. Already crossed by power line(s).
Private/UDWR	CWMUs	Antelope Creek (31,853 acres), Bear Mountain (8,037 acres), Castle Valley Outdoors (10,558 acres), Crab Creek (10,409 acres), Double R Ranch (6,390 acres), Emma Park (22,471 acres), Hiawatha (15,355 acres), Johnson Mountain Ranch (13,330 acres), Minnie Maud Ridge (16,030 acres), Oak Ranch (4,670 acres), Old Woman Plateau (8,165 acres), Round Valley (7,976 acres), Scofield Canyons (15,658 acres), Soldier Summit (26,127 acres).
Emery County	Bear Creek Campground	Located 8 miles up Huntington Canyon, the campground provides 29 campsites and 2 pavilions.
Private	Big Mountain Campground	Located 5 miles east of Nephi, Utah, the campground provides RV camping, fishing, and camping amenities at the base of the Nebo Loop Scenic Byway.
Ouray Park Irrigation Company	Brough Reservoir	Blue ribbon trophy trout fishing.
Uintah and Ouray Indian Reservation	Bottle Hollow Reservoir	Used for fishing.
Western Rio Blanco Metropolitan Recreation and Park District	Cedar Ridges Golf Course	Par 36, 9 hole public golf course near Rangely, Colorado.
Church of Jesus Christ of Latter Day Saints	Camp Timberlane	The camp consists of 720 acres of forest land at the top of Argyle Canyon. The camp consists of 4 major campgrounds, a summer home for the Camp Manager, a smaller campground, a family size "A" frame and 2 individual campsites. The camp is generally available from early June to Labor Day. Several hiking trails also are available.

# 3.13.5.3 Region III

The BLM is the main federal agency providing recreation opportunities in this region. Five BLM Field Offices provide recreation areas within the analysis area that contain few to no developed facilities. Despite the lack of facilities, there are many recreation opportunities available on lands within the region, including hiking, camping, rock climbing, horseback riding, hunting, OHV use, scenic driving, fishing, mountain biking, and competitive OHV events. In addition, there are recreation opportunities available on NFS lands on the Dixie National Forest and USFWS lands on the Desert NWR; the NWR is discussed in Section 3.15, Special Designation Areas. There is one private recreation site within the region, Newcastle Reservoir. A brief description of dispersed recreation opportunities by BLM FO and national forest within the Region III analysis area is included in **Table 3.13-13**. **Table 3.13-14** identifies Scenic Byways and Backways within the Region III analysis area. **Table 3.13-16** identifies all federally managed special recreation management areas and **Table 3.13-16** identifies all state and locally managed recreation areas within the Region III analysis area. **Figure 3.13-4** identifies all recreation areas within the Region III analysis area.

Table 3.13-13 Forest Service-Managed Recreation Opportunities within Region III Analysis Area

Managing Entity	Key Dispersed Recreation Activities within Analysis Area	
Fillmore FO, Utah	4.7 million acres of BLM-managed public lands located on the eastern edge of the Basin and Range Geographic Province.  Portions of the FO are in both Region II and Region III. Dispersed recreation opportunities within the Region III portions of the FO include hunting, fishing, hiking, rock hounding, and OHV use. The FO also contains several state-managed WMAs. Cultural tourism sites include the Dominquez-Escalante trail. The 129-mile Cricket Mountains ATV loop trail system is located within the analysis area.	
Cedar City FO, Utah	2.2 million acres of BLM-managed public lands. The FO area is characterized by vast acres of sagebrush and pinyon-juniper clade foothills, home to greater sage grouse, the Utah prairie dog, the Southwest Desert Elk Herd, and the Sulphur Wild Horse Herd - at breed of horse noted by its distinct markings and Spanish genetics. Dispersed recreation opportunities within the FO include primitive camping, hiking, horseback riding, OHV use, bird watching, rock hounding, mountain biking, nature study, and photography. Cultural tourism sites include the Dominquez-Escalante trail. The analysis area also contains portions of the American Discovery Trail, a system of 6,800 miles of recreational trails and roads that collectively form a coast-to-coast hiking an biking trail across the U.S.	
St George FO, Utah	635,000 acres of BLM-managed public lands. Located at the merge point of the Mojave Desert, the Great Basin, and the Colorado Plateau ecosystem, these public lands are a rich mix of geologic formations, biological habitats, scenic landscapes, and cultural history. Recreation activities range from casual sightseeing and hiking to more physically demanding activities such as mountain biking, ATV riding, rock climbing, horseback riding, and canyoneering. Other activities include geocaching and cultural tourism (including the Dominquez-Escalante and Old Spanish trails).	
Caliente FO, Nevada	4.2 million acres of BLM-managed public lands. Much of the FO area is representative of the Great Basin with large expanses of rolling sagebrush and grasses. Recreation opportunities include hunting (pronghorn, mule deer, elk), hiking, biking, horseback riding, camping, OHV use, and rock hounding. The analysis area includes portions of the Silver State OHV trail, a 260-mile congressionally designated OHV trail and BLM Backcountry Byway; there are several trailheads in and near the town of Caliente. The Chief Mountain area is frequently used for OHV riding and includes three developed trailheads, 413 miles of roads, OHV routes and trails, including 39 miles of the Silver State Trail. The Oak Springs Summit Trilobite Area is located 12 miles west of Caliente. Areas of the FO within the analysis area include portions of the Chief Mountain and North Delamar SRMAs. The analysis area includes portions of the Highway 93 Scenic Byway and Rainbow Canyon Backcountry Byway.	
Las Vegas FO, Nevada	2.4 million acres of BLM-managed public lands, portions of which are included in both Region III and Region IV. Dispersed recreation opportunities within the Region III analysis area include hunting, camping, and OHV use. The FO permits a number of commercial and competitive high speed desert events. Other recreation opportunities within the analysis area include rock climbing in Arrow Canyon and recreational driving along the Bitter Springs Backcountry Byway.	

Table 3.13-13 Forest Service-Managed Recreation Opportunities within Region III Analysis Area

Managing Entity	Key Dispersed Recreation Activities within Analysis Area			
Dixie National Forest	1.7 million acres of USFS-managed public lands. The analysis area includes portions of the Pine Valley Ranger District.			
	Recreational opportunities are highly diversified and include camping, hunting, viewing scenery, hiking, horseback riding, and			
	fishing in both primitive settings and developed areas. Vehicle-based activities include camping, picnicking, hunting, gathering			
	forest products, viewing interpretive exhibits,	viewing scenery, sn	owmobiling, and	biking. Developed recreation opportunities within
	the analysis area include the Mountain Mead	dows Massacre Site	and the Ox Valle	y ATV Trail. Considered as a whole, the Dixie
	National Forest contains the following acrea	ge by ROS class:		
	Urban	N/A	0%	
Rural N/A 0%				
	Roaded Modified	N/A	0%	
	Roaded Natural	54,848 acres	3%	
	Semi-primitive Motorized	115,513 acres	7%	
Semi-primitive Non-motorized 225,221 acres 13% Primitive 67,292 acres 4%				
	Non-inventoried, unknown, or private	1,248,423 acres	73%	
	TOTAL	1,711,297 acres	100%	
	The analysis area includes acreage within roaded natural, semi-primitive motorized, and semi-primitive non-motorized ROS classes.

Table 3.13-14 Scenic Byways and BLM Backways within Region III Analysis Area

Name	Length/Designation	Description
Highway 93 Scenic	148.8-mile Nevada State Scenic Byway	Route provides high desert scenery with views of Mount Gafton, Dutch John Peak,
Byway	between the town of Crystal and the	and the Wilson Creek Range. Roadway passes through Pioche, an early 20 <sup>th</sup> century
	Humboldt-Toiyabe National Forest on	mining camp filled with historic buildings.
	Highway 93 in eastern Nevada	
Rainbow Canyon	21-mile BLM Backcountry Byway	Route provides views of Rainbow Canyon, a deep canyon full of red rock and unique
Backcountry Byway		rock formations. The road closely follows the busy Union Pacific Railroad.
Bitter Springs	28-mile BLM Backcountry Byway	Scenic drive with many rock formations, like the Muddy Mountains, and colorful
Backcountry Byway		sandstone for sightseeing. Byway features include abandoned borax mines.
Silver State OHV	260-mile BLM Backcountry Byway	OHV trail network offering access to the rugged, scenic, and remote deserts and
Trail		mountains of eastern Nevada. The trail system can be accessed from Panaca,
		Pioche, and Caliente. There are five main trailheads to access the Silver State Trail;
		Patterson, Pahroc Wash, Stampede, Chief Mountain South, and Chief Mountain
		West.

Sources: BLM 2012n, 2008f, 1998, 1997c, 1987a,b, 1986; Exploring Nevada.com 2012; Great Basin Institute 2012; USDOT 2012.

Table 3.13-15 Federally Managed Special Recreation Management Areas within Region III Analysis Area

Managing Entity	Recreation Site/Area <sup>1</sup>	Description
Caliente FO,	Chief Mountain SRMA	111,181 acres. Recreation opportunities include rock hounding, trilobite collecting, camping, hunting, and
Nevada		both event-organized and casual OHV riding. The SRMA contains 413 miles of roads, OHV routes, and
		trails. The Chief Mountain SRMA is crossed by 38.7 miles of the Silver State Trail. Both the West and South
		Chief Mountain trailheads provide access to this trail. The SRMA contains two trilobite collection areas.

Table 3.13-15 Federally Managed Special Recreation Management Areas within Region III Analysis Area

Managing Entity	Recreation Site/Area <sup>1</sup>	Description
Caliente FO,	North Delamar SRMA	202,890 acres. Managed for a broad spectrum of recreation opportunities to ensure a balance of recreation
Nevada		experiences. A wide range of activities occur within the SRMA including backcountry driving, hunting, OHV
(Continued)		use, competitive racing, heritage tourism, and hiking.
Las Vegas FO, Nevada	Muddy Mountains SRMA	123,400 acres. Managed to provide integrated management of wildlife habitat, cultural resources, and recreational uses. 78,480 acres managed as a semi-primitive non-motorized area; 44,897 acres managed as a semi-primitive motorized area.
	Nellis Dunes SRMA	10,000 acres. Managed as an open area for intensive OHV and other recreation opportunities, including organized OHV events, casual OHV freeplay, picnicking, photography, and other non-OHV commercial and competitive permitted activities. Portions of this SRMA are within Region III and IV.

<sup>&</sup>lt;sup>1</sup>Within each BLM FO, other specially designated areas, such as WSAs, WSRs, wilderness areas, or ACECs have recreational use, but are not designated specifically for recreational use. These other areas are analyzed in Section 3.15, Special Designations.

Table 3.13-16 State and Locally Managed Recreation Areas within Region III Analysis Area

Managing Entity Management Area		Description
Private/UDWR CWMUs		Zane (9,779 acres)
Newcastle Irrigation Company		The Newcastle Irrigation Company owns the reservoir and presently provides unrestricted public access to the shoreline for fishing.

Sources: UDEQ 2011.

# 3.13.5.4 Region IV

Recreation opportunities in this region are primarily provided by the BLM and NPS. Several BLM areas provide opportunities for scenic driving, OHV use, and trail use. NPS provides developed recreation opportunities at two campgrounds in the Lake Mead NRA, in addition to trail use opportunities on the River Mountains Loop Trail and on backcountry roads. Region IV also includes a county wetlands park, a city park renowned for its mountain biking trails, and a private golf course.

Currently, there are no National Scenic Byways or BLM-designated Scenic Byways or Backways within Region IV. The Nevada Commission on Tourism currently is facilitating the nomination of Lakeshore and Northshore Roads within Lake Mead NRA for State Scenic Byway status. The nomination is primarily honoring the scenic, cultural, and natural features found along these road corridors.

A brief description of recreation opportunities on federally managed lands is included in **Table 3.13-17**. **Table 3.13-18** identifies all federally managed special recreation management areas within the Region IV analysis area, and **Table 3.13-19** identifies all state, local, or privately managed recreation areas within the Region IV analysis area. **Figure 3.13-5** identifies all recreation areas within the Region IV analysis area.

Table 3.13-17 Federally Managed Recreation Opportunities within Region IV Analysis Area

Managing Entity	Key Recreation Activities within Analysis Area
Las Vegas FO, Nevada	2.4 million acres of BLM-managed lands, portions of which are included in both Region III and Region IV.  Dispersed recreation opportunities within the Region IV analysis area include the River Mountains Loop Trail, a 32-mile loop trail circling the River Mountains and linking residential areas to local and regional parks, including Bootleg Canyon to the south and Lake Mead NRA to the east. Camping is dispersed outside of the Red Rock NCA and not allowed within Las Vegas Valley, which includes areas west of the Lake Mead NRA including the northern portion of Sloan Canyon NCA, Las Vegas Valley SRMA, Nellis Dunes SRMA, and the western portion of the Muddy Mountains wilderness area/SRMA. These same areas are generally closed to OHV use, with the exception of Nellis Dunes, which is a popular OHV open use area. The Eldorado Valley, Nelson Hills and Jean/ Dry Lake areas are also popular OHV use areas.
NPS Lake Mead NRA	The NRA contains 1,482,476 acres of federal land and 28,212 acres of nonfederal land. Lake Mead NRA offers year-round recreational opportunities for boating, fishing, hiking, photography, picnicking and sightseeing. A portion of the Boulder Basin Zone of the NRA is within and adjacent to the analysis area. The majority of visitors to this zone are day users; overnight accommodations are limited. There are two developed areas:  • Las Vegas Bay is the closest area to Las Vegas and therefore attracts a large number of day use visitors; includes camping and picnicking facilities.  • Boulder Harbor/Beach is the largest and most heavily visited development in the recreation area; offers camping, picnicking, RV hookups, and boat launch and harbor areas.  The area also contains several trails including a bluffs trail, wetlands trail, a historic railroad trail, and a portion of the River Mountains Loop Trail. The area also offers recreational driving opportunities along Lakeshore Drive.
BLM Sloan Canyon NCA	48,000 acres. Managed to conserve, protect, and enhance the cultural, archaeological, natural, wilderness, scientific, geological, historical, biological, wildlife, educational, and scenic resources of this area. The area features important archaeological sites, scenic vistas, important wildlife habitat, and opportunities for primitive recreation. The northern end of the NCA is designated as a roaded natural area and contains a system of hiking and biking trails. The southeast portion is managed for semi-primitive non-motorized recreation. The western portions contain the North McCullough wilderness areas and are managed for primitive recreation.

Sources: BLM 2012o,p, 2006, 1998; City of Henderson 2012; NPS 1987, 2012.

Table 3.13-18 Federally Managed Special Recreation Management Areas within Region IV Analysis Area

Managing Entity	Name	Description
Las Vegas FO, Nevada	Nelson/Eldorado SRMA	81,600 acres. Offers competitive OHV events in accordance with desert tortoise protection requirements, including up to nine speed events scheduled only between November 1 and February 28 if within critical tortoise habit
Las Vegas FO, Nevada	Sunrise Mountain SRMA	37,620 acres. Offers recreation opportunities in concert with sensitive plant, scenic, cultural, and geologic values of the concurrent ACEC. Recreation opportunities include non-speed motorized and mechanized activities on designated roads.
Las Vegas FO, Nevada	Las Vegas Valley SRMA	197,300 acres. Designated to facilitate the provision of open space areas, recreational trails, and parks necessary for valley residents in coordination with county and city governments.
Las Vegas FO, Nevada	Nellis Dunes SRMA	10,000 acres. Managed as an open area for intensive OHV and other recreation opportunities, including organized OHV events, casual OHV freeplay, picnicking, photography, and other non-OHV commercial and competitive permitted activities. Portions of this SRMA are within Region III and IV.

Sources: BLM 2012o, 1998.

Table 3.13-19 State- and Locally Managed Recreation Areas within Region IV Analysis Area

Managing Entity	Name	Description
Clark County	Clark County Wetlands Park	2,900 acre nature and wildlife habitat viewing area bordering both sides of the Las Vegas Wash between Frenchman Mountain and Lake Mead. The park features a 100-acre nature preserve area with an information center, concrete walking trails, and graveled secondary trails. The park offers hiking, equestrian, and mountain biking opportunities.
Boulder City Parks and Recreation Department	Bootleg Canyon	Contains miles of popular mountain bike trails of varying degrees of difficulty and a commercial zipline operation.
Private	Cascata Golf Course	Privately owned par-72 luxury golf course featuring lush fairways, lakes, and streams surrounded by canyons. Rated #1 in the country by Zagat Survey in 2008.

Sources: bootlegcanyon.net. 2012; Cascatagolf.com 2012; Clark County 2012; flightlinezboootlegcanyon.com 2012.

# 3.13.6 Impacts to Recreation

The NEPA scoping process revealed the public's concerns with impacts to recreation at specific locations, increases in traffic from construction, and the effects of noise and the "humming" sound from transmission lines on recreation users. Comments also were received related to the future use of access roads; comments were received that advocated for public use of access roads, as well as designing access roads to minimize unpermitted off-road vehicle use.

This section analyzes the impacts that construction, and operation, maintenance and decommissioning of the transmission line would have on recreational resources and opportunities, as well as recreational expectations and the likelihood for user satisfaction throughout the analysis area. Recreational resources are defined as the natural elements within the environment that provide the physical basis for recreation. Recreational opportunities are defined as the combination of the natural elements (e.g., scenery, vegetation, geology, land forms, weather) and human-controlled conditions (e.g., roads and trails, developed sites, facilities) that create the potential for recreation and may include dispersed or specially managed opportunities. Recreational expectations are those assumptions made by the user that, having prepared for the desired recreational experience and having entered the area of opportunity, he/she would have that expected experience (e.g., the natural sights and sounds of an undeveloped landscape while hiking or during a river rafting trip, a scenic drive through high quality scenery, or a hunting trip into areas with high quality wildlife habitat). It is important to note that achieving recreational expectations are not guaranteed regardless of the presence of the resource and the opportunity; unforeseen and/or changing conditions that are beyond the control of the managing entity or the user can influence and partially determine the user experience. User satisfaction can be defined as that subjective evaluation of the recreation activity in which the resource user recognizes that his/her recreational experiences meet or exceed his/her recreational expectations.

While recognizing that recreation resource users are individuals with uniquely personal expectations, goals, and levels of recreational satisfaction, it was assumed for the purposes of impact analysis that:

- Recreation users within the analysis area could be classified into general user groups based on their primary recreation activity, each of which has its own set of recreational opportunities and expectations; and
- 2. Based on these opportunities and expectations, each group also has specific recreational conditions and criteria that increase the likelihood for having satisfying user experiences.

The following sections outline key recreation user groups that exist within the analysis area. Each user group description identifies the types of recreational opportunities and expectations associated with

each group, and in general, types of construction and operation impacts that would impact those opportunities and expectations.

### 3.13.6.1 Scenic Drivers

This group primarily would include users of passenger cars and recreational vehicles (RVs) driving for pleasure while enjoying scenic attractions. Recreationists that also could be included in this group are recreational aircraft users that enjoy scenic views from above. Recreational opportunities include scenic highways and byways and other areas where scenic integrity can be accessed by roads. The desired recreational experience for this user group generally relies upon paved access to scenic attractions (with the ability to access turnoffs and/or temporary parking) and developed campsites. During construction, activities that would result in high traffic volumes, crowded or closed parking areas or turnoffs, or construction activities and fugitive dust directly along the route would adversely affect this user group, as would noise and visual disturbances within developed campsites. During operations, impacts to the scenic attraction that can be viewed from the paved viewpoints, day use areas, or within developed campsites would adversely affect this user group.

### 3.13.6.2 Hunters and Wildlife Viewers

This group would include those using BLM and NFS lands, state-managed wildlife management areas, or conservation easement areas for hunting of a variety of wildlife species, though generally big game or upland game avian species. The desired recreational experience for this user group generally relies upon unimpeded access during hunting seasons to key hunting areas, dispersed camping areas, and a generally natural-appearing environment containing sufficient wildlife habitat to support the species. During construction, activities that would remove wildlife habitat, or would cause access road or area closures or noise and human activity affecting wildlife during hunting seasons would adversely affect this user group. During operations, impacts are expected to be lower for this user group, with the exception of noise and activities from transmission line maintenance. Facilities and human activities could be present if they do not interfere with access, degrade or remove habitat, impede wildlife movement or cause avoidance behaviors, or otherwise interfere with potential for hunting success; however, wildlife photographers would be impacted by the presence of human structures.

## 3.13.6.3 Motorized (Off-highway) Drivers

This group would include users of off-road motorcycles, dune buggies, all-terrain vehicles (ATVs), 4-wheel drive vehicles, and other OHVs. Recreation opportunities would include all designated OHV use areas and trails. The desired recreational experience for this user group generally relies upon a somewhat natural-appearing environment with non-paved surfaces ranging from graded dirt roads to challenging routes with some evidence of human sights, sounds, and disturbances to remote, natural-appearing environments. The presence of construction activity and some presence of human-constructed structures are acceptable; however, road or trail closures during either construction or operation would adversely affect this user group. If new roads or routes were left open for use by the general public, this generally would be positive for this group due to additional OHV access.

### 3.13.6.4 Mountain Bikers

The desired recreational experience for this user group generally relies upon a relatively natural or natural appearing environment in which evidence of human disturbances, restrictions, and controls is present but not appearing to dominate the environment. Recreation opportunities would include all roads and trails where mechanized travel is permitted. During construction, trail or trailhead facility closures and noise or dust/vehicle emissions would have adverse impacts on this group's recreational experience. Operations are assumed to have few adverse impacts to this group, as long as trails are not permanently closed.

### 3.13.6.5 Non-mechanized Users

This group would include hikers, backpackers, and equestrians. The desired recreational experience of this group generally relies upon dispersed recreation opportunities within a natural-appearing environment with little evidence of disturbance. Such areas would include national recreation or scenic trails as well as other hiking trails developed by the managing entity for day or extended use. During construction, closure to trails, trailhead facilities, or camping areas, and visual impacts and noise or dust/vehicle emissions would have adverse impacts on this group's recreational experience. During operations, visual impacts from the transmission line that cannot be mitigated would adversely affect this user group. In addition, visual impacts from the maintenance of transmission line roads and routes also would adversely affect this user group.

# 3.13.6.6 Recreational Boaters and Anglers

This user group includes primarily people who recreate on non-motorized boats such as canoes, kayaks, and rafts. Recreational opportunities in the analysis area primarily consist of floating on the Yampa and Green rivers. The needs of this group are similar to those of the non-mechanized user group. In general, the desired recreational experience for this user group relies upon a natural-appearing environment that shows little evidence of human disturbances within the river corridor, other than at the river access points and designated primitive campsites. During construction, closures to access points, noise, dust/vehicle emissions, and visual disturbances along the river corridor would have adverse impacts on this group's recreational experience. During operations, visual impacts to the river corridor's scenic quality would adversely affect this user group. The desired recreational experience for anglers would include many of these factors, but would rely more heavily on factors that lead to fishing success (i.e., access to key fishing areas, undisturbed waters, etc.), and less on undisturbed land vistas. Access point closures, noise or human activity along river corridors, or sedimentation affecting water quality or fish habitat would have adverse impacts on this group's recreational experience; therefore, impacts to this user group are expected to occur primarily during construction.

For each user group and within each Region, the analysis identifies the following:

- Impacts to resources that underlie recreational use (e.g., impacts to big game or big game habitat within WMAs or dispersed hunting areas);
- Temporary or permanent closures to existing recreational opportunities from construction or operation of the transmission line and facilities, including any permitted special events;
- Temporary or permanent access restrictions to recreational opportunities from construction or operation of the transmission line and facilities; and
- Changes to the recreation setting of recreational opportunities (noise, visual) that would not meet user expectations.

Effects were determined by assessing the location of Project facilities associated with each alternative in relation to existing recreation opportunity areas. This assessment was conducted by using maps of recreation facilities and use areas overlaid with maps showing the location of Project transmission lines and support facilities. The analysis area for recreation includes all recreation facilities and areas within the 2-mile transmission line corridor. Impacts were determined by reviewing recreation activities that take place within affected areas, including typical use periods, users, and activity requirements to determine potential impacts from both construction and operations on recreation facilities, recreation use, recreation users, and the recreation setting. Impacts are described for both dispersed recreation and recreation at developed sites. In addition to typical recreation activities affected, the acreages of affected dispersed recreation areas are included, as are acreages for affected ROS classes within national forests. Impacts to key user groups also are described, as are general impacts to the key

recreation seasons most affected by construction and maintenance activities. Especially noted are impacts to recreation activities or facilities for which displaced visitors cannot easily find a substitute.

Aesthetic effects identified in Section 3.12, Visual Resources, were used to evaluate adverse effects on the recreation setting, including degraded scenic vistas, or establishment of highly obtrusive features. Obtrusive noises, identified in Section 3.18, Public Health and Safety, were considered in relation to the location of recreation opportunities and uses to evaluate adverse effects to the recreation setting. Obtrusive noises, such as construction equipment movement, earthwork, tree removal, other short-term construction activities, and operational transmission line "buzzing" were considered in comparison to other existing noise sources on nearby recreational activities. Potential effects on wildlife or aquatic resources were determined using the findings presented in Sections 3.5, Vegetation; 3.6, Special Status Plant Species; 3.7, Wildlife Resources; 3.8, Special Status Wildlife Species; 3.9, Aquatic Resources; and 3.10, Special Status Aquatic Resources. Section 3.14, Land Use, and Section 3.16, Transportation and Access, provided the basis for addressing changes in land use and management or access to recreation opportunities.

# 3.13.6.7 Impacts from Terminal Construction and Operation

The northern and southern terminals would be constructed regardless of alternative route or design option. This section describes the impacts to recreation from terminal construction and operation.

### Northern Terminal

The Northern Terminal would be located on private property southwest of Sinclair, Wyoming. There is no public use of the proposed Northern Terminal area for recreation and no known private recreation use occurs on or adjacent to the property. Land areas around the terminal area are used for dispersed recreation.

During construction, recreational uses in adjacent portions of the CDNST SRMA area closest to the Northern Terminal could be temporarily affected by noise and activity; however, there are no special management areas and no recreational use that could not occur on other public lands.

No impacts to recreation are anticipated from construction and operation of the proposed Northern Terminal because there is no public use or known recreation use occurring at the site.

## Southern Terminal

The Southern Terminal would be located primarily on private property southwest of Boulder City, Nevada. Existing substations and energy facilities are located in the area. There is no public use of the private property within the proposed Southern Terminal area for recreation; however, there could be some unauthorized OHV use on private property due to OHV use on adjacent BLM lands. The Southern Terminal area includes three acres of the eastern edge of the Sloan Canyon NCA; the Southern Terminal Alternative would be located within this area. Impacts to the Sloan Canyon NCA are discussed in Section 3.15, Special Designations.

# Design Option 2 - DC from Wyoming to IPP; AC from IPP to Marketplace Hub

Because the implementation of Design Option 2 would utilize the same alternative routes and construction techniques as the Proposed Project, impacts from construction and operation of this design option would be similar to those discussed under the alternative routes. Differences between this design option and the Proposed Project include the locations of the southern converter station and ground electrode systems, as well as the addition of a series compensation station midway between the IPP and Marketplace. The southern converter station would be located near the IPP in Utah instead of at the Marketplace in Nevada and the ground electrode system would be within 50 miles of the IPP. Construction and operation of a converter station near IPP, and a series compensation station would not be expected to impact recreation resources beyond what is described for Project impacts.

Construction of the ground electrode site near the IPP would affect 112,569 acres of undesignated BLM lands available for dispersed recreation in the Fillmore FO. Please see Section 3.13.6.8 for general construction and operation impacts to dispersed recreation for a description of potential impacts to recreation from construction and operation of the Delta ground electrode site.

# Design Option 3 - Phased Build-Out

Because the implementation of Design Option 3 would utilize the same alternative route, facilities, and construction techniques as the Proposed Project, impacts from construction and operation of this design option would be the same as those discussed under the alternative routes. The additional substation near the IPP needed for Design Option 3 would not be expected to impact recreation resources beyond what is described for Project impacts.

# 3.13.6.8 Impacts Common to all Alternative Routes and Associated Components

Construction and operation of all of the alternative routes in each analysis area region would entail impacts to undesignated, general BLM and NFS lands (i.e., the lands do not contain specific recreation facilities or activities, or are not designated for specific purposes). Undesignated BLM and NFS lands typically receive dispersed hunting, fishing, camping, and OHV use. In general, a large portion of the land managed by each BLM FO or national forest is undesignated. This section includes a description of the general impacts that power line construction, operations and maintenance, and decommissioning would have on dispersed recreation. Context and intensity would vary by alternative and would depend upon acreage losses (i.e., acreage encumbered with facilities) or used during construction, the specific user group, and landscape characteristics near the construction area. These issues are discussed in greater detail by region, FO, and national forest in Sections 3.13.6.9 to 3.13.6.12. Impacts to designated recreational areas/sites or areas with known developed uses also are described by region, FO, and national forest in these sections. Any recreation-related BMPs within the relevant management plans, such as measures to protect the recreation viewshed or setting, would be required of the applicant to minimize impacts to recreation resources.

# General Construction Impacts to Dispersed Recreation

During construction, noise or visual presence of construction activities could temporarily affect the experiences of visitors participating in dispersed recreation opportunities near the construction area (generally limited to those areas within the 2-mile transmission line corridor). Construction is expected to affect dispersed recreation use particularly on the weekends (Saturdays; there will be no construction on Sundays); seasons of use may vary by region and are discussed in Sections 3.13.6.9 to 3.13.6.12. The duration of transmission line construction activities on any given parcel of land may extend up to a year, although the total amount of time of actual construction activity would be much shorter, in the range of a few months. Over any particular section of the route, transmission line construction would be characterized by short periods (ranging from a day to 1 to 2 weeks) of relatively intense activity interspersed with periods of no activity.

Construction generally would result in vegetation (habitat) removal within the entire 250-foot-wide transmission line ROW. Roads and construction support areas would be built within the 2-mile transmission line corridor, resulting in additional surface disturbance. At peak construction levels, human activity would be high and noise would generally be above existing background levels within the entire width of the 2-mile transmission line corridor (see Section 3.18, Public Health and Safety, for a discussion of noise); however, terrain and vegetation of the area could provide visual screening and noise attenuation. As discussed in Section 3.13.6, some user groups would be more affected by habitat removal, noise and visual disturbance than others; for example, hunters, wildlife viewers and mountain biker user groups, whose recreation experience is dependent upon quiet natural experiences or undisturbed wildlife would be more affected than OHV users or other activities for which vegetation removal, noise, and human activity does not affect the recreation experience. Section 3.13.6 provides a list of key user groups and assumptions related to changes in their

recreation experience from transmission line construction. In most cases, dispersed recreation opportunities are not limited to one particular locale and suitable substitute locations would exist nearby for the same dispersed recreational activities. Exceptions are described by region, FO, and national forest in Sections 3.13.6.9 to 3.13.6.12. Construction also could temporarily affect the ability of visitors to participate in dispersed recreation opportunities by limiting access. As noted in Section 3.16, Transportation and Access, Project construction would create short-term, minor and incidental increases in local traffic, but the construction phase is not expected to create substantial congestion for extended periods. Site specific access construction impacts are not provided in Section 3.16 at this stage due to the length of the corridors for each alternative; therefore, recreation site-specific access construction impacts are only discussed generally within this section. Road Access Plans will be developed for the Agency Preferred Alternative once it has been determined. Please see Section 3.16, Transportation and Access, for a description of the construction phase mitigation regarding the preparation of Road Access Plans and Construction Period Traffic Management Plans for the corridor as part of the COM Plan.

## General Operation Impacts to Dispersed Recreation

Operations would result in permanent visual impacts to areas along the transmission line, including areas used for dispersed recreation. While these impacts would not appreciably affect the availability of the recreation resource used while engaging in dispersed recreational activities (i.e., big game or fish habitat), the setting in which they occur would be affected visually and some users may choose to recreate elsewhere. In general, suitable substitute locations would exist nearby for the same dispersed recreational activities. Exceptions are described by region, FO, and national forest in Sections 3.13.6.9 to 3.13.6.12.

Maintenance activities, particularly maintenance of access roads and vegetation management could affect access to recreation sites/areas; however, any access impediments or delays from Project-related activities would be temporary. Maintenance activities and vegetation management also could temporarily affect the ability of some user groups to participate in certain recreation opportunities (e.g., hunting, wildlife viewing) or affect the recreation experiences of visitors adjacent to maintenance work sites due to noise from maintenance activities. Transmission line maintenance activities are expected to occur infrequently; the frequency and type of vegetation maintenance activities would vary by area but could involve annual maintenance programs. Maintenance-related noise could temporarily affect adjacent hunting, fishing, and wildlife viewing opportunities by making the area less hospitable for wildlife or fish. In addition, maintenance-related noise also could temporarily affect adjacent opportunities for solitude or viewing scenery. Annual ground inspections would likely not result in any impacts to recreation opportunities or experiences. Semi-annual aerial inspections (passing helicopters) could result in temporary noise effects to the ambient recreation setting of any adjacent or nearby recreation site/area. Section 3.13.6 provides a list of key user groups and assumptions related to changes in their recreation experience from transmission line operation.

Project access roads would be evaluated on a case-by-case basis by the appropriate federal or state land manager to determine whether to close roads to the public, close and reclaim roads, or leave roads open as part of the transportation network. Roads to be closed to the public would have signage indicating the restriction or regulation, location, penalty for violation, and appropriate contact information for reporting violations. Despite the presence of closure signs, closed roads may become an attractive nuisance and lead to unauthorized OHV use and associated resource damage, noise, etc. Other deterrents such as barriers, contouring, and revegetation may be used to indicate closed roads as determined on a site-specific basis depending on site-specific needs, management requirements, and reasonable application of the treatment. The proponents would monitor permanent roads on NFS land and BLM-administered lands yearly, and the applicable land-managing agency will be provided with annual monitoring reports. If TWE-maintained access roads remain available for public use, continued maintenance of these roads would be a beneficial impact for those recreationists seeking motorized recreational opportunities and increased access in the area; conversely, such roads

Draft FIS June 2013 could adversely impact recreational opportunities for solitude or non-motorized recreational experiences.

# General Decommission Impacts to Dispersed Recreation

At the end of the project's 50-year ROW grant, or when it is determined that the project is no longer economical, the project would be decommissioned and the area reclaimed. During decommissioning, the level of effort, equipment needed, and phasing to decommission the transmission lines and support facilities would be similar to constructing the facilities. Chapter 2 and **Appendix D** contain information regarding the preparation of Reclamation Plans.

# 3.13.6.9 Region I

**Table 3.13-20** provides a summary of Region I recreation areas/sites by alternative, both within the 250-foot-wide transmission line ROW and within the 2-mile transmission line corridor.

Table 3.13-20 Region I Recreation Areas within the 250-foot-wide Transmission Line ROW and 2-mile Transmission Line Corridor

	Alternative I-A	Alternative I-B	Alternative I-C	Alternative I-D 250-foot-wide ROW

## Alternative I-A (Applicant Proposed)

Alternative I-A would cross dispersed recreation areas in three FOs, one specially managed recreation area, one wildlife area in Wyoming and one in Colorado. Alternative I-A also would affect one Yampa River access point and cross the river once.

# BLM Dispersed Recreation Areas

General construction impacts to dispersed recreation activities are described in Section 3.13.6.8 and would affect recreationists by displacing visitors due to area closures, noise or visual presence of construction, or making the area inhospitable for wildlife. Within Region I, the 250-foot-wide transmission line ROW for Alternative I-A would impact 1,764 acres of dispersed recreation area in the Rawlins FO, 1,328 acres within the Little Snake FO, and 373 acres within the White River FO during construction. The 2-mile transmission line corridor for Alternative I-A, would encompass approximately 78,251 acres of dispersed recreation area in the Rawlins FO; 51,779 acres within the Little Snake FO; and 13,799 acres within the White River FO during construction. This is 2.2 percent, 4.1 percent, and less than 1 percent, respectively, of total available acreage for dispersed recreation in each FO and represents the maximum area that could be temporarily removed from use during construction due to surface disturbance, increased noise, and human activity. These impacts would be greatest to the hunters and wildlife viewer user group due to the direct loss of habitat, and to non-mechanized users such as hikers or backpackers, due to aesthetic impacts that would make recreation experiences in those areas undesirable. It also is important to note that construction is sequential; therefore, not all acreage within the 2-mile transmission line would be subject to noise and human activity at the same time.

Recreation use in Region I would be affected most during the summer, when general recreation use peaks in this area, and during the fall and winter (generally September to February), when most big game hunting occurs. There are no high use areas identified within the Rawlins or White River FOs that would be near or within the 2-mile transmission line corridor. Within the Little Snake FO,

Alternative I-A would pass though important hunting areas west of Maybell. These areas would likely be lost to hunting during construction (see Section 3.8, Wildlife Resources for more information regarding avoidance behavior of big game from noise); however, the areas outside the 2-mile transmission line corridor, to which big game likely would be displaced, are federal lands that are open to hunting.

Within the Rawlins FO, Alternative I-A would cross Muddy Creek; within the Little Snake FO, the Alternative I-A would cross the Little Snake and Yampa rivers. There are no high recreational use areas or access points to Muddy Creek or the Little Snake River within the 2-mile transmission line corridor. Alternative I-A would cross the Yampa River near a high use access area west of Maybell (the East Cross Mountain access point). The access point would be within the 2-mile transmission line corridor, resulting in adverse impacts to recreational boaters or anglers on the river and campers at the access point due to the sounds and sights of construction. Impacts to the Yampa River are discussed in greater detail as part of the Yampa State Park analysis, below. Alternative I-A also would cross the Yampa Valley Trail west of Maybell. The trail is commonly used for mountain biking, horseback riding, hiking, wildlife viewing, and OHV use. However, use of the trail in this area is low; the more popular trail segment is in the Little Yampa Canyon SRMA (BLM 2010). Though construction activities could potentially degrade the recreation setting from construction noise and activities, only a small section of the trail would be temporarily affected and the majority of nearby trail mileage would not be affected. If visitors participate in recreation opportunities near the construction area (generally within the 2-mile transmission line corridor), recreation experiences for visitors could be temporarily degraded from construction noise and activities.

Operation of Alternative I-A would affect 1,764 acres of the 250-foot-wide transmission line ROW within the Rawlins FO; 1,328 acres within the Little Snake FO; and 373 acres within the White River FO. This represents <0.1 percent of each FO. Operation would have minimal impacts to most dispersed recreation experiences (see Section 2.14.6.2); however, the presence of a transmission line crossing the Yampa River would be a permanent adverse impact to the river recreation experience. Maintenance activities also could disrupt hunting and wildlife watching activities due to noise and human presence. Due to the importance of the area around Maybell for big game hunting, the following additional mitigation measure is recommended to reduce the potential for impacts to hunting:

**REC-1**: Where practicable, operation phase vegetation maintenance activities within dispersed recreation areas or key hunting locales would not occur during big game hunting seasons.

Implementation of this measure would be highly effective in reducing impacts to hunting activities and also would be a beneficial impact to worker safety.

BLM SRMAs or Other Specially Managed Recreation Areas

CDNST and SRMA. On BLM lands within the Rawlins FO, approximately 1.4 miles of the CDNST would be included within the 2-mile transmission line corridor for Alternative I-A; the 250-foot-wide transmission line ROW would not include the CDNST on BLM lands. Approximately 0.1 miles and 1.5 miles of the CDNST would be included within the 250-foot-wide transmission line ROW and 2-mile transmission line corridor, respectively, on private land under Alternative I-A. The crossing of CDNST by the transmission line would occur on private property. Approximately 4 acres of the 250-foot-wide transmission line ROW would be within the 600-acre CDNST SRMA. This is approximately 0.1 percent of the SRMA, which covers about 82 miles of trail. Approximately 179 acres of the 2-mile transmission line corridor, in which roads and construction support areas could be constructed, also would be located within the SRMA. The trail/SRMA is managed to provide primitive recreational experiences and the scenic trail has national importance. Impacts to the trail itself would be minimized by the placement of the transmission line ROW within a designated overhead utility corridor; towers would be placed to avoid surface disturbance near the actual trail. Impacts from construction, as described in Section 3.13.6, would adversely affect the non-mechanized user group (hikers, backpackers, and

equestrians). Visual impacts would be permanent; however, operation of the line is unlikely to appreciably affect the overall recreational experience of the SRMA and trail because of the small percentage of area affected and the recreational experience and character of the trail at this location is already impacted by an existing 230- to 287-kv transmission line and the I-80 crossing. The transmission line would be consistent with SRMA management objectives because the line would be located within a designated utility corridor. Development of additional roads would have adverse impacts to the SRMA by subjecting it to construction noise and visual impacts. Impacts to the SRMA could be reduced with application of the following mitigation measures.

**REC-2**: Within designated recreation management areas, access shall be limited to existing roads whenever practicable. If new and improved access cannot be avoided within these areas, access roads shall be closed or rehabilitated through methods and monitoring developed through consultation with the landowner or land management agency. Methods for closure could include gates, obstructions such as berms or boulders, or partial or full restoration to natural contour or vegetation.

**REC-3**: If designated corridors exist within the recreation area, new roads and ancillary construction areas shall only be located within designated utility corridors.

Use of existing roads or placement of new roads and construction areas only within the designated corridor would be highly effective in limiting impacts to areas in which these actions are consistent with area management.

Within the Little Snake FO, no SRMAs would be located within either the 250-foot-wide transmission line ROW or the 2-mile transmission line corridor. The 2-mile transmission line corridor would be located approximately less than one mile outside of the South Sand Wash SRMA, but would not enter the SRMA. The portion of the SRMA that is closest to the 2-mile transmission line corridor is an isolated patch of open OHV play area (Zone I). The prescribed setting is "rural" (i.e., on or near improved country roads and a highway) and with conspicuous and large-scale landscape alteration from OHV use. Construction noise levels and visual disturbances would not be inconsistent with Zone I management. During operation, recreation in the SRMA is unlikely to be appreciably affected by the transmission line because the recreational experience can accommodate large scale landscape alteration.

## State-managed Recreation Areas

Red Rim-Daley WHMA. Within Wyoming, approximately 2 miles of the 250-foot-wide transmission line ROW and 2,847 acres of the 2-mile transmission line corridor for Alternative I-A would fall within the Red Rim-Daley WHMA. This 25,177-acre WHMA provides crucial winter habitat for pronghorn antelope and a variety of other wildlife and is used recreationally for hunting and wildlife watching. During construction, approximately 58 acres (0.2 percent of the WHMA) of wildlife habitat would be removed. During peak construction, it is likely that big game would be temporarily displaced from the entire 2,847-acre portion of the 2-mile transmission line corridor within the WHMA (11 percent of the WHMA) due to their avoidance response (see Section 3.7, Wildlife, for a full discussion of noise impacts on wildlife). Access roads and construction staging areas also could be constructed within the 2-mile transmission line corridor, further fragmenting habitat and extending the area affected by construction noise and activity. Implementation of timing restrictions would prevent disturbance to wintering big game (TWE-32 and TWE-33 as well as BLM, USFS, and state wildlife agency restrictions); however, vegetation removal would still occur for transmission line and road construction.

Application of **REC-2** would minimize this impact by limiting access to existing roads within the WHMA and/or requiring full reclamation of any roads that are constructed. This would reduce habitat modification and fragmentation; however, 58 acres of habitat (0.2 percent of the WHMA) would still have some level of vegetation maintenance during operations that could affect habitat.

Construction of Alternative I-A would adversely affect the hunter and wildlife viewer user group through habitat removal, restricted access to areas undergoing construction, and by displacing wildlife in and near construction zones. Recreationists seeking wildlife watching experiences would be adversely impacted by these activities regardless of their timing. Hunters would largely be adversely impacted only if these activities were scheduled during active hunting seasons. Due to the checkerboard nature of land ownership, recreationists may not be able to easily move to other areas of the WHMA to follow wildlife movement, and wildlife may be displaced to areas that are not open to public use. The following additional mitigation measure is recommended to reduce the potential for impacts to hunting:

**REC-4**: Where practicable, construction activities within key hunting locales such as WHMAs/WMAs/SWAs would not occur during big game hunting seasons.

Implementation of this measure would be highly effective in reducing impacts to hunting activities and also would be a beneficial impact to worker safety.

Operation of the transmission line is unlikely to affect hunting or other wildlife-dependent recreation activities. Some visitors seeking a completely natural setting (such as wildlife photographers) might choose to visit areas without transmission lines; however, the majority of the WHMA would be visually undisturbed. The noise and activity associated with annual maintenance could temporarily displace wildlife. Application of **REC-1** (scheduling vegetation maintenance outside of big game hunting seasons where practicable) would further minimize impacts to hunting. Please see Section 3.18, Public Health and Safety, and Section 3.12, Visual Resources, for additional details regarding operational noise and visual impacts.

Raftopolous Hunting Lease and Other Public Access Program Areas. Within Colorado, no WMAs would be located within either the 250-foot-wide transmission line ROW or the 2-mile transmission line corridor; however, approximately 617 acres of the 2-mile transmission line corridor would fall within the 11,383-acre Raftopolous hunting lease. The Raftopolous hunting lease area and several smaller parcels of State Trust Lands that are part of the Public Access Program are open to hunting (CPW 2011). Application of **REC-2** would limiting access to existing roads within the area and/or require full reclamation of any roads that are constructed; however, wildlife in this 617-acre portion of the hunting lease (approximately 5 percent of the total lease area) could still be temporarily displaced by noise and activity from nearby ROW construction. However, the other 95 percent of the hunting lease area would still be available to hunters and the areas surrounding the lease are BLM lands that also are open to hunting.

Yampa River State Park. Alternative I-A would pass through the Yampa River State Park and cross the river at an access point west of Maybell, Colorado. Construction and operation would permanently adversely affect the recreation setting for boaters on the Yampa River as the transmission line would substantively change the visual setting of this mostly undeveloped river. Additionally, the State Park's East Cross Mountain access point (River Mile 60) would be within the 2-mile transmission line corridor. The East Cross Mountain access point offers camping and picnicking in addition to river access. The access point would remain open during construction; however, recreational river users, campers, and picnickers would experience noise and visual disturbances. The nearest State Park access point is about 11 miles upstream, but does not offer camping and has minimal facilities. The Maybell Bridge access point, located 3 miles east of Maybell and 28 miles upstream from the East Cross Mountain access point, is the closest improved access point offering camping. There also are two access points downstream (River Mile 55 and 46) managed by the NPS; however, the river is expert class beyond river mile 60 (class 5-6 within Cross Canyon). The following mitigation measures are recommended to reduce impacts to campers in the area:

**REC-5**: No construction shall be allowed after 5:00 p.m. on weeknights, and no construction shall be allowed on weekends, holidays, or the opening of big game hunting seasons in areas that are adjacent to developed recreation sites.

**REC-6**: Construction zones will be sited such that access to high use recreational areas and trails is not impeded. If public safety concerns are such that current access or use cannot be maintained, the applicant will work with the appropriate land manager to develop alternative access points or redirect users to alternative existing points of access.

Application of these measures would reduce the adverse impacts from noise and visual disturbances from construction activity during key recreational use times and ensure continued recreational access was available. However, noise and visual impacts would be present during weekdays. Long term visual impacts from operation would not be mitigated.

### Local Recreation Areas

There are no local recreation areas within Alternative I-A.

### Scenic Byways and Backways

Within the Rawlins FO, Alternative I-A would cross the Outlaw Trail Scenic Loop Highway; one crossing within the 250-foot-wide transmission line ROW, and 1.3 miles within the 2-mile transmission line corridor. Though not a nationally designated scenic byway, this route is recommended for recreational drivers in the area (Carbon County Visitors Council 2012). The transmission line would cross the highway near its junction with I-80. Scenic drivers would be subject to views of road construction near the byway and also would be able to view the transmission line (see Section 3.12, Visual Resources, for more information). Viewshed impacts from development of new access roads within the 2-mile transmission line corridor would be permanent unless fully restored. Impacts would be reduced through application of **REC-2**, which would limited access to existing roads near the highways and/or require full reclamation of any roads that are constructed. During construction, the affected portion of the highway also could experience additional traffic for segments used for employee commute, supply delivery, etc. (see Section 3.16, Transportation).

# Alternative I-B

Alternative I-B would cross dispersed recreation areas in three FOs, two specially managed recreation areas, and one wildlife area in Wyoming. Alternative I-B also would also cross the Yampa River once.

## BLM Dispersed Recreation Areas

The 2-mile transmission line corridor for Alternative I-B would impact 76,336 acres of dispersed recreation area in the Rawlins FO; 63,149 acres within the Little Snake FO; and 13,799 acres within the White River FO during construction. This is 2.2 percent, 5.0 percent, and less than 1 percent of total available acreage for dispersed recreation in each FO, respectively, and represents the maximum area that could be temporarily removed from use during construction due to surface disturbance, increased noise, and human activity. Impacts to dispersed recreation and suggested mitigation would be the same as described under Alternative I-A, except that no designated access point to the Yampa River would be located within the 2-mile transmission line corridor.

Within the Rawlins FO, the 250-foot-wide transmission line ROW would encompass 101 acres (less than 0.1 percent) of the Adobe Town DRUA; the 2-mile transmission line corridor would encompass 4,420 acres (less than 2 percent) of the Adobe Town DRUA. The 250-foot-wide transmission line ROW would be located entirely in areas with Front Country ROS designations. These areas are roughly consistent with the Roaded Natural ROS class described in **Table 3.13-4**; development would be consistent with recreation management goals for this area. The 2-mile transmission line corridor primarily would include Front County areas, as well as approximately 460 acres of Middle Country and 20 acres of rural areas. Development of roads and other construction support areas would be fully consistent with recreation goals for the rural areas, but would not be fully consistent with recreation management goals for the Middle Country areas, which provide for a recreational setting with a low concentration of users and some isolation from sights and sounds of development, while allowing for

motorized and mechanized equipment use. Application of **REC-2** would minimize impacts to recreation in these areas.

Operations would affect 1,847 acres of 250-foot-wide transmission line ROW within the Rawlins FO; 1,217 acres within the Little Snake FO; and 373 acres within the White River FO. This represents less than 0.1 percent of each FO. Impacts to dispersed recreation and suggested mitigation would be the same as described under Alternative I-A.

BLM SRMAs or Other Specially Managed Recreation Areas

<u>CDNST SRMA</u>. Impacts to the CDNST SRMA would be the same as described under Alternative I-A. No other SRMAs would be affected by Alternative I-B.

State-managed Recreation Areas

Red Rim-Daley WHMA. Impacts to the Red Rim-Daley WHMA would be the same as described under Alternative I-A.

<u>Yampa River State Park</u>. Impacts to Yampa River State Park would be similar to those described under Alternative I-A except there are no State Park river access sites within the 2-mile transmission line corridor.

Local Recreation Areas

There are no local recreation areas within Alternative I-B.

Scenic Byways and Backways

Impacts to the Outlaw Trail Scenic Loop highway would be the same as described under Alternative I-A.

# Alternative I-C

Alternative I-C would cross dispersed recreation areas in three FOs, four specially managed recreation areas, and two wildlife areas in Wyoming and two in Colorado. Alternative I-C also would affect four Yampa River access points and cross the river three times.

## BLM Dispersed Recreation Areas

The 2-mile transmission line corridor for Alternative I-C would impact 58,224 acres of dispersed recreation area in the Rawlins FO; 28,629 acres within the Little Snake FO; and 13,799 acres within the White River FO during construction. This is 1.7 percent, 2.3 percent, and less than 1 percent of total available acreage for dispersed recreation in each FO, respectively, and represents the maximum area that could be temporarily removed from use during construction due to surface disturbance, increased noise, and human activity. Impacts to dispersed hunting, wildlife, and river boating and suggested mitigation would be similar to those described under Alternative I-A, except that Alternative I-C would cross the Yampa River a total of three times and four river access points would fall within the 2-mile transmission line corridor. Impacts to river access points are discussed further under State Recreation Areas, below. Operations would affect 1,350 acres of 250-foot-wide transmission line ROW within the Rawlins FO; 770 acres within the Little Snake FO; and 373 acres within the White River FO. This represents less than 1 percent of each FO. Impacts to dispersed recreation and suggested mitigation would be the same as described under Alternative I-A.

BLM SRMAs or Other Specially Managed Recreation Areas

CDNST SRMA. Impacts to the CDNST SRMA would be the same as described under Alternative I-A.

Juniper Mountain SRMA. Within the Little Snake FO, approximately 1 mile of the 250-foot-wide transmission line ROW and 1,437 acres of the 2-mile transmission line corridor for Alternative I-C would fall within the northern portion of the 1,780-acre Juniper Mountain SRMA. The 250-foot-wide transmission line ROW would cross the Yampa River just west of the SRMA. The SRMA is managed for boating, hunting, camping, and hiking. The portion of the SRMA within the 2-mile transmission line corridor is primarily within Zone 2, which is managed for national- and regional-level destination big game hunting, as well as hiking, camping, and horseback riding. The prescribed setting is natural backcountry, where landscape alterations are uncommon, and the area is managed as VRM Class II within line of sight of the river. Alternative I-C would cross the Yampa River downstream of the SRMA; however, the Juniper Mountain access points would be within the 2-mile transmission line corridor and the transmission line would be visible to river users within the SRMA. Operation of the transmission line would not be in conformance with the prescribed recreation setting for the SRMA (natural backcountry, where landscape alterations are uncommon, and VRM Class II within line of sight of the river) and would result in adverse impacts to user groups such as river boaters, hikers, and backpackers, whose recreational experience is dependent upon a natural landscape. Impacts to river users within the SRMA also are discussed under Yampa River State Park, below.

During construction, approximately 40 acres (2.2 percent of the SRMA) of wildlife habitat would be removed from the 250-foot-wide transmission line ROW. During peak construction, it is likely that big game would be temporarily displaced from the entire 1,437-acre portion of the 2-mile transmission line corridor located within the SRMA (81 percent of the SRMA) due to the avoidance response of big game. Access roads and construction staging areas also could be constructed within the 2-mile transmission line corridor, further fragmenting habitat and extending the area affected by construction noise and activity. Implementation of timing restrictions (TWE-32 and TWE-33 as well as BLM, USFS, and state wildlife agency restrictions) would prevent disturbance to wintering big game; however, vegetation removal would still occur for transmission line and road construction. Application of REC-2 would minimize this impact by limiting access to existing roads within the SRMA and/or requiring full reclamation of any roads that are constructed. This would reduce habitat modification and fragmentation; however, 40 acres of habitat (2.2 percent of the SRMA) would still have some level of vegetation maintenance during operations that could affect habitat.

Construction would adversely affect the hunter and wildlife viewer user group through habitat removal, restricted access to areas undergoing construction, and by displacing wildlife in and near construction zones. Construction also would adversely affect the non-mechanized user group (hikers, backpackers, and equestrians) that recreate in this SRMA through construction activity and noise. Recreationists seeking wildlife watching experiences or natural settings would be adversely impacted by these activities regardless of their timing. Hunters would be adversely impacted only if these activities were scheduled during active hunting seasons. Due to the importance as a national- and regional-level destination for big game hunting, application of **REC-4** (scheduling construction outside of hunting seasons) is recommended to reduce impacts to this activity. Application of **REC-1** (scheduling vegetation maintenance outside of big game hunting seasons where practicable) would further minimize impacts to hunting during operations. Application of **REC-5** would minimize impacts to all recreation user groups by prohibiting construction during weekends and other high use periods in areas that are adjacent to developed recreation sites.

Serviceberry SRMA. Approximately 1,462 acres (11.8 percent) of the 12,380-acre Serviceberry SRMA lie within the 2-mile transmission line corridor in which roads and other construction facilities would be located. This portion of the SRMA (Zone 2) is managed for non-motorized big game hunting and undeveloped camping. Recreation needs and potential impacts of construction and operation to these user groups are described under Section 3.13.6. Application of mitigation measures **REC-2** would reduce impacts to this area by eliminating roads or requiring full reclamation; however, this portion of the SRMA could still experience noise and activity from nearby ROW construction. This would still result in adverse impacts to non-motorized recreation users such as campers. Hunters also would be affected if construction occurs during hunting season and they could not or chose not to move to

others areas of the SRMA. A very small portion (less than 1 acre) of the 2-mile transmission line corridor also falls within the Little Yampa Canyon SRMA. Application of mitigation measures **REC-2** would reduce impacts to this area by eliminating roads within this area.

State-managed Recreation Areas

Red Rim-Daley WHMA. Impacts to the Red Rim-Daley WHMA would be the same as under Alternative I-A.

Upper Muddy Creek Watershed/Grizzly WHMA. Within Wyoming, approximately 19 acres of the 250-foot-wide transmission line ROW and 1,015 acres of the 2-mile transmission line corridor for Alternative I-C would fall within the 59,780-acre Upper Muddy Creek Watershed/Grizzly WHMA. The WHMA is a utility ROW avoidance area and is managed to protect Colorado River fish species unique to the Muddy Creek watershed and crucial winter habitat for elk and mule deer. Recreation is primarily limited to hunting, angling, and wildlife viewing. Motorized vehicle use is limited to designated roads and vehicle routes. Implementation of timing restrictions during both construction and operation phases (TWE-32 and TWE-33 as well as Rawlins FO restrictions) would prevent disturbance to wintering big game; however, there would still be some loss of big game habitat. Habitat loss would be minimized through application of REC-2, which would limit access to existing roads within the WHMA and/or require full reclamation of any roads that are constructed. Construction impacts within the WHMA would primarily affect hunters, anglers and wildlife watchers. Impacts to hunters and wildlife watchers would be similar to those described under the Red Rim-Daley WHMA under Alternative I-A. Application of REC-4 would reduce this impact by rescheduling construction activities within key hunting locales, such as WHMAs, outside of hunting seasons. Impacts to anglers would be primarily related to maintaining watershed quality and aquatic species habitat. Construction would result in surface distance and erosion and sedimentation that has potential to affect the watershed or aquatic species for which the WHMA is managed; however, total vegetation removal within the 250-foot-wide transmission line ROW comprises less than 1 percent of the WHMA and the area in which roads would be located comprises less than 1.7 percent of the WHMA. Application of REC-2 would further minimize impacts to the resources used by anglers.

Bitter Brush SWA. Within Colorado, approximately 107 acres of the 250-foot-wide transmission line ROW and 4,921 acres of the 2-mile transmission line corridor for Alternative I-C would fall within the 8,057-acre Bitter Brush SWA. The 250-foot-wide transmission line ROW would be located within a designated utility corridor within the SWA near an existing transmission line. This area is primarily used for hunting and wildlife viewing; public access within the SWA is prohibited from January 15 through April 30. During construction, approximately 1.3 percent of the SWA would be removed from use as wildlife habitat. During peak construction, it is likely that big game would be temporarily displaced from the entire 4,921-acre portion of the 2-mile transmission line corridor located within the SWA (61 percent of the SWA) due to the avoidance response of big game (see Section 3.7, Wildlife, for a full discussion of noise impacts on wildlife). Access roads and construction staging areas also could be constructed within the 2-mile transmission line corridor, further fragmenting habitat and extending the area affected by construction noise and activity. Impacts to recreation would be similar to those described for the Red Rim-Daley WHMA under Alternative I-A. Implementation of timing restrictions would prevent disturbance to wintering big game; however, vegetation removal would still occur for transmission line and road construction. Application of REC-2 would minimize this impact by limiting access to existing roads within the SWA and/or requiring full reclamation of any roads that are constructed. This would reduce habitat modification and fragmentation; however, 107 acres of habitat (1.5 percent of the SWA) would still have some level of vegetation maintenance during operations that could affect habitat. Construction would adversely affect the hunter and wildlife viewer user group through habitat removal, restricted access to areas undergoing construction, and by displacing wildlife in and near construction zones. Recreationists seeking wildlife watching experiences would be adversely impacted by these activities regardless of their timing. Hunters would largely be adversely impacted only if these activities were scheduled during active hunting seasons. Due to the pattern of

land ownership in the area and the large area of the SWA that would be affected by construction activity, wildlife may be displaced to areas outside the SWA that are not open to public use. Application of **REC-4** would reduce impacts to hunters. Operation of the transmission line is unlikely to affect hunting or other wildlife-dependent recreation activities. Some visitors seeking a completely natural setting (such as wildlife photographers) might choose to visit areas without transmission lines; however, the majority of the SWA would be visually undisturbed. The noise and activity associated with annual maintenance could temporarily displace wildlife. Application of **REC-1** would further minimize impacts to hunting from operations.

Yampa River SWA. Approximately 199 acres (23 percent) of the 860-acre Yampa River SWA lie within the 2-mile transmission line corridor in which roads and other construction facilities would be located; the 250-foot-wide transmission line ROW would be located to the west and outside of the SWA. This SWA is managed primarily for waterfowl hunting and river-based recreation, and includes an unimproved river access site that is part of Yampa River State Park. Construction and operation impacts to river users would be similar to those discussed for Yampa River State Park under Alternative I-A; however, this access point does not offer camping. Application of **REC-2** would minimize impacts to recreation opportunities within the SWA by limiting access to existing roads; however, waterfowl in this 199-acre portion of the SWA could still be temporarily displaced by noise and activity from nearby ROW construction, adversely affecting wildlife viewers and hunters.

Yampa River State Park. Under Alternative I-C, there would be a total of three river crossings of the Yampa River, one slightly downstream of the Yampa River SWA, one downstream of the South Beach (Pump Station) access point, and one downstream of the Juniper Mountain access point. As discussed above, any river crossings would adversely impact the setting of the river and would affect the recreational experiences of boaters and anglers in the area. These impacts constitute an adverse impact to the Yampa River State Park system as a whole, which offers recreation of statewide significance. The Juniper Mountain and South Beach access points are both within the 2-mile transmission line corridor in which roads and other construction support areas could be built. Both access points offer overnight camping. During construction, there would be adverse impacts to recreationists using those areas for camping or other forms of non-mechanized recreation due to construction noise and activity. Application of **REC-2** would minimize this impact by limiting access to existing roads in areas near the access points, but would not eliminate noise and visual impacts from the construction of the transmission line. Campers seeking to avoid impacts at the South Beach access point would need to move 32 miles downstream to the Duffy Mountain access point, or get permission to camp at Loudy Simpson Park, located 5 miles upstream. Campers seeking to avoid impacts at the Juniper Mountain access point would need to camp at the Duffy Mountain campsite (12 miles upstream), or portage the diversion dam within Juniper Canyon and continue on through advanced boating areas to the Maybell Bridge access point, located 6 miles downstream. Application of REC-5 and REC-6 would minimize impacts to all recreation user groups by prohibiting construction during weekends and other high use periods in areas that are adjacent to developed recreation sites and ensure continued access to developed recreation sites.

#### Local Recreation Areas

<u>Juniper Hot Springs</u>. The 2-mile transmission line corridor would encompass Juniper Hot Springs, a privately owned mineral springs and camping area located south of Maybell, Colorado, and is the only known recreational hot springs location in the area. Hot springs visitors and campers would be adversely affected by construction activity and noise. Other camping areas nearby would continue to be available during construction; however, there would be no other hot springs locations for any displaced users. Application of **REC-2** would limit access to existing roads and/or require full reclamation of any new roads. Application of **REC-5** and **REC-6** would reduce impacts to campers and hot springs users by prohibiting construction during weekends and other high use periods and maintaining access to high use areas. However, noise and visual impacts would be present during

weekdays. Section 3.17, Social and Economic Conditions, addresses the economic impacts of construction on this facility.

### Scenic Byways and Backways

Within the Rawlins FO, the 2-mile transmission corridor would include 2 miles of the Battle Scenic Highway from Baggs to Encampment (WY 70) and 38 miles of the Outlaw Trail Scenic Loop (Highway 789) from Baggs to Highway 80. These are not nationally designated scenic byways, but are recommended routes for recreational drivers in the area. Scenic drivers using the roads would be subject to views of road construction near the byway and also would be able to view the transmission line (see Section 3.12, Visual Resources, for more information). Viewshed impacts from development of new access roads within the 2-mile transmission line corridor would be permanent unless fully restored. Impacts would be reduced through application of **REC-2**, which would limit access to existing roads near the highways and/or require full reclamation of any roads that are constructed. During construction, portions of the highways also could experience additional traffic on portions used for employee commute, supply delivery, etc. (see Section 3.16, Transportation).

# Alternative I-D (Agency Preferred)

Alternative I-D would cross dispersed recreation areas in three FOs, one specially managed recreation area, and one wildlife area in Wyoming. Alternative I-D also would cross the Yampa River once.

## BLM Dispersed Recreation Areas

The 2-mile transmission line corridor for Alternative I-D would impact 94,929 acres of dispersed recreation area in the Rawlins FO; 63,149 acres within the Little Snake FO; and 13,799 acres within the White River FO during construction. This is 2.7 percent, 5.0 percent, and less than 1 percent of total available acreage for dispersed recreation in each FO, respectively, and represents the maximum area that could be temporarily removed from use during construction due to surface disturbance, increased noise, and human activity. Impacts to dispersed recreation and suggested mitigation would be the same as described under Alternative I-A, except that no designated access points to the Yampa River would be located within the 2-mile transmission line corridor.

Operations would affect 2,297 acres of the 250-foot-wide transmission line ROW within the Rawlins FO, 1,217 acres within the Little Snake FO, and 373 acres within the White River FO. This represents less than 1 percent of each FO. Impacts to dispersed recreation and suggested mitigation would be the same as described under Alternative I-A.

# BLM SRMAs or Other Specially Managed Recreation Areas

<u>CDNST SRMA</u>. Impacts to the CDNST SRMA would be the same as described under Alternative I-A. No other SRMAs would be affected by Alternative I-D.

Dinosaur National Monument. The 2-mile transmission line corridor for Alternative I-D, including all three Tuttle Easement micro-siting options, includes 16 acres of the Dinosaur National Monument along Deerlodge Road at the road's junction with US Highway 40. One acre of the 250-foot-wide transmission line ROW for Tuttle Easement Micro-Siting Option 3 would be located within the National Monument. Deerlodge Road is the only road entrance to the eastern portion of the monument and provides access to a campground, ranger station, and the only Yampa River boat launch site in the National Monument (NPS 2013a). Construction activities within the National Monument could affect visitor access to the campground, boat launch site and ranger station due to traffic delays or temporary short-term road closures. Construction also could affect visitor's recreation experiences due to noise, delays, and visual intrusions from construction activities. Operation of the Tuttle Easement Micro-Siting Option 3 could affect recreation use and visitors to the national monument because the transmission line would cross Deerlodge Road under this option. Thus, maintenance activities could affect visitor access and recreation experiences due to traffic delays or temporary road closures.

## State-managed Recreation Areas

Red Rim-Daley WHMA. Impacts to the Red Rim-Daley WHMA would be the same as described under Alternative I-A.

<u>Yampa River State Park</u>. Impacts to Yampa River State Park would be similar to those described under Alternative I-B.

### Local Recreation Areas

There are no local recreation areas within Alternative I-D.

## Scenic Byways and Backways

Impacts to the Outlaw Trail Scenic Loop Highway would be the same as described under Alternative I-A.

# Alternative Connectors in Region I

There are no designated SRMAs affected by the Mexican Flats, Baggs Alternative, Fivemile Point North Alternative, or Fivemile Point South Alternative connectors. Only general recreation uses that occur on undesignated lands within the Rawlins FO would be affected. In addition, the Mexican Flats, Baggs, and Fivemile Point North alternative connectors would cross the Outlaw Trail Scenic Loop Highway. **Table 3.13-21** summarizes impacts associated with the alternative connectors in Region I.

Table 3.13-21 Summary of Region I Alternative Connector Impacts to Recreation

Alternative Connector	Analysis <sup>1</sup>
Mexican Flats Alternative Connector	Affects recreation on 8,686 acres of undesignated BLM lands within the 3.5 million-acre Rawlins FO. This is 0.2 percent of lands within the FO available for dispersed recreation. Would cross the Outlaw Trail Scenic Loop Highway.
Baggs Alternative Connector	Affects recreation on 20,497 acres of undesignated BLM lands within the 3.5 million-acre Rawlins FO. This is 0.6 percent of lands within the FO available for dispersed recreation. Would cross the Outlaw Trail Scenic Loop Highway.
Fivemile Point North Alternative	Affects recreation on 2,430 acres of undesignated BLM lands within the 3.5 million-acre Rawlins FO. This is 0.1 percent of lands within the FO available for dispersed recreation. Would cross the Outlaw Trail Scenic Loop Highway.
Fivemile Point South Alternative	Affects recreation on 999 acres of undesignated BLM lands within the 3.5 million-acre Rawlins FO. This is <0.1 percent of lands within the FO available for dispersed recreation.

Acres represent the maximum area that could be temporarily removed from use during construction due to surface disturbance, increased noise, and human activity.

# Alternative Ground Electrode Systems in Region I

The Shell Creek Alternative I-A, Eight Mile Basin (all alternatives), and Separation Creek (all alternatives) would have the greatest impact on recreation as they would be located near designated recreation areas. Smaller areas that are partially located on public land would have less impact on recreation, such as the Separation Flat and Little Snake East alternatives. **Table 3.13-22** provides a comparison of alternative electrode bed locations proposed near the northern terminal. Some locations might serve multiple alternative routes, while others could only be associated with a certain alternative route.

Table 3.13-22 Summary of Region I Alternative Ground Electrode System Location Impacts to Recreation

Alternative Ground Electrode System Locations	Analysis
Separation Flat – All Alternative Routes	128 acres of disturbance from construction, 39 acres from operations. Affects undesignated BLM lands. Would affect less public recreation use because only a portion of the site is publicly owned.
Shell Creek (Alternatives I-A and I-D)	223 acres of disturbance from construction, 89 acres from operations. Affects undesignated BLM lands within and west of Adobe Town DRUA. Has the greatest impact on recreation due to footprint size and distance from corridor.
Little Snake East (Alternatives I-A, I-B, and I-D)	108 acres of disturbance from construction, 29 acres from operations. Affects undesignated BLM lands. Affects less public recreation use because only a portion of the site is publicly owned.
Little Snake West (Alternative I-A)	121 acres of disturbance from construction, 37 acres from operations. Affects State lands open to public hunting (7 acres of the Little Snake SWA), as well as undesignated BLM lands.
Shell Creek (Alternative I-B)	189 acres of disturbance from construction, 71 acres from operations. Affects undesignated BLM lands west of Adobe Town DRUA. Has a greater impact on recreation because of large footprint and distance from the corridor.
Little Snake West (Alternatives I-B and I-D)	93 acres of disturbance from construction, 21 acres from operations. Affects State lands that are open to public hunting (7 acres of the Little Snake SWA), as well as undesignated BLM lands.
Eight Mile Basin – All Alternative Routes	86 acres of disturbance from construction, 18 acres from operations. Affects 406 acres of the CDNST SRMA and the Rim Lake Recreation site, as well as undesignated BLM lands.
Separation Creek – All Alternative Routes	138 acres of disturbance from construction, 48 acres from operations. Affects 3,956 acres of the Red Rim – Daley WHMA, as well as undesignated BLM lands.

# Region I

Alternative I-C would affect the most federal and state-managed recreation sites of the four Region I alternatives. In comparison, Alternative I-D (Agency Preferred) would affect the fewest recreation sites, would not affect any high use sites, and would not cross the Yampa River at a developed access point. Therefore, with implementation of mitigation measures **REC-1**, **REC-2**, **REC-3**, and **REC-4**, this alternative would have the least impact on recreation use, activities, and setting. Alternative I-A (Applicant Proposed) is similar to Alternative I-D, however, Alternative I-A also would affect a high use Yampa River access point, as well as hunting in the Raftopolous Hunting Lease area, though implementation of mitigation measures **REC-2**, **REC-5**, and **REC-6** would reduce adverse impacts to recreation use and users at these two locations.

# 3.13.6.10 Region II

**Table 3.13-23** through **Table 3.13-27** provide a summary of Region II recreation areas/sites by alternative, both within the 250-foot-wide transmission line ROW and the 2-mile transmission line corridor.

# Alternative II-A (Applicant Proposed)

Alternative II-A would cross dispersed recreation areas in five FOs and two national forests (including several developed recreation sites), one specially managed recreation area, one state park, nine WMAs/units, two CWMUs, one private campground, and one reservoir. Alternative II-A also would cross three scenic byways.

Table 3.13-23 Region II BLM Recreation Areas within the 250-foot-wide Transmission Line ROW and 2-mile Transmission Line Corridor

Recreation Area/Site	Alternative II-A 250-foot-wide ROW 2-mile Corridor Acres (% of Total Area)	Alternative II-B 250-foot-wide ROW 2-mile Corridor Acres (% of Total Area)	Alternative II-C 250-foot-wide ROW 2-mile Corridor Acres (% of Total Area)	Alternative II-D 250-foot-wide ROW 2-mile Corridor Acres (% of Total Area)	Alternative II-E 250-foot-wide ROW 2-mile Corridor Acres (% of Total Area)	Alternative II-F 250-foot-wide ROW 2-mile Corridor Acres (% of Total Area)

<sup>\*\*</sup> Indian Canyon Scenic Byway shares the same route with Dinosaur Diamond Prehistoric Byway in this portion of the Byway, therefore the acreage identified under the Indian Canyon route also is included in the Dinosaur Diamond route.

## BLM Dispersed Recreation Areas

Within Region II, the 250-foot-wide transmission line ROW for Alternative II-A would impact 587 acres of dispersed recreation area in the White River FO, 1,113 acres within the Vernal FO, 38 acres within the Richfield FO, 3 acres within the Salt Lake FO, and 1,257 acres within Fillmore FO. The 2-mile transmission line corridor for Alternative II-A, which represents the maximum area that could be temporarily removed from use during construction due to surface disturbance, increased noise, and human activity, would encompass the following acreages of dispersed recreation area within each FO:

- White River FO: 22,827 acres (1.6 percent of total available acreage for dispersed recreation within the FO).
- Vernal FO: 38,850 acres (2.5 percent of total available acreage for dispersed recreation within the FO).
- Richfield FO: 1,378 acres (0.1 percent of total available acreage for dispersed recreation within the FO).
- Salt Lake FO: 323 acres (0.0 percent of total available acreage for dispersed recreation within the FO).
- Fillmore FO: 49,166 acres (1.1 percent of total available acreage for dispersed recreation within the FO).

Construction activities associated with Alternative II-A could temporarily affect the ability of visitors to participate in non-motorized recreation such as hiking or camping by displacing visitors due to noise or visual presence of construction, or making the area inhospitable for wildlife (i.e., would affect wildlife viewing, hunting, and fishing, see Section 3.13.6). Construction is assumed to affect motorized recreation to a lesser degree unless access is restricted to trails. There are no identified high use areas identified within the 2-mile transmission line corridor for the White River, Fillmore, Richfield, and Salt Lake FOs. Construction would affect recreation use, particularly on the weekends (Saturdays; there will be no construction on Sundays) and during the summer at higher elevation areas, and during the spring and fall at lower elevations. In general, there are other nearby locations that visitors could temporarily go during construction activities that offer the same recreation opportunities in a similar environment as are provided in Alternative II-A recreation areas. Operation of the transmission line could affect the visual setting of dispersed recreational opportunities, though in general, the line follows existing transmission lines. Maintenance activities could displace wildlife, affecting hunting or wildlife viewing activities.

Within the Vernal FO, the portion of the transmission line between Starvation State Park and Fort Duchesne would be located near the edge of two deer hunting units (9A and 11). During construction, wildlife may be displaced to areas that are not within the unit. Application of **REC-5**, which would limit construction during the opening of big game seasons in areas near developed recreation sites, would assist in limiting impacts, but would not fully eliminate this risk along the entire portion of the route.

## BLM SRMAs or Other Specially Managed Recreation Areas

Little Sahara RA. Within the Fillmore FO, the 250-foot-wide transmission line ROW would cross 183 acres of the 60,000 Little Sahara RA. The 2-mile transmission line corridor, which represents the maximum area that could be temporarily removed from use during construction due to surface disturbance, increased noise, and human activity, would encompass 5,974 acres of the RA. These acreages comprise 0.3 percent and 10 percent of the RA, respectively. The majority of the area that would be affected is outside the boundary fence and therefore likely receives little use (BLM 2011d). The 2-mile transmission line corridor is well away from designated camping areas. As a result, minimal impacts are expected to recreation from construction. As discussed in Section 3.13.6, some presence of human-constructed structures would be acceptable to the motorized driver user group, the key user

group for the RA. Section 3.12, Visual Resources, and **Appendix I** provide additional detail regarding visibility and compliance with visual objectives for the RA.

### USFS Recreation Areas

Within Region II, the 250-foot-wide transmission line ROW for Alternative II-A would impact 545 acres of dispersed recreation area in the Uinta National Forest and 78 acres within the Manti-La Sal National Forest.

<u>Uinta National Forest</u>. Within the Uinta National Forest, over 80 percent of the 250-foot-wide ROW would fall primarily within the roaded modified and roaded natural ROS classes. These types of areas are managed for recreation in ways that allow for readily evident to moderate evidence of the sights and sounds of human activity. The sights and sounds of construction would be in conformance with area management, though they would cause temporary adverse impacts to scenic drivers, hikers, campers and other non-motorized user groups identified in Section 3.13.6.

Areas classified as semi-primitive motorized, while having some evidence of other users and motorized use, have a low concentration of users, and a predominantly natural or natural-appearing environment. Approximately 11,800 acres of the 2-mile transmission line corridor would be in areas classified as semi-primitive motorized. This is 49 percent of the total acreage of the 2-mile transmission line corridor located within the Uinta National Forest (24,213 acres) and 3.3 percent of all semi-primitive motorized ROS acreage within the Uinta National Forest. The total 2-mile transmission line corridor acreage represents the maximum area that could be temporarily removed from use during construction due to surface disturbance, increased noise, and human activity. The sights and sounds of construction and presence of large construction crews and construction traffic would not be consistent with the recreation goals for the semi-primitive motorized areas. Over 85 percent of this acreage (or 10,102 acres) would be located within one or more IRAs. Construction within IRAs would use roadless construction methods identified in Appendix D, including helicopter construction, overland travel smaller ROW, selective vegetation management, etc. This would reduce some impacts to semi-primitive motorized areas by eliminating road construction; however, helicopter construction and/or overland travel itself also likely would be a temporary adverse impact to recreationists in these areas. Please see Section 3.15, Special Designation Areas, for additional impacts to IRAs. The remaining 1,698 acres of semi-primitive motorized areas would not have roadless construction restrictions. This area comprises approximately 0.5 percent of all semi-primitive motorized acreage within the Uinta National Forest.

As discussed in Section 3.13.6, construction would adversely affect the hunters and wildlife viewer user groups through habitat removal, restricted access to areas undergoing construction, and by displacing wildlife in and near construction zones. Recreationists seeking wildlife watching experiences or natural settings would be adversely impacted by these activities regardless of their timing. Hunters would be adversely impacted only if these activities were scheduled during active hunting seasons. Additionally, the 2-mile transmission line corridor would be partially located in areas where adjacent deer hunting units abut (units 17A and 17V and units 16A and 12/16B/16C).

High use/developed areas within the Uinta National Forest identified within the 2-mile transmission line corridor include Long Hollow Trail, Teats Mountain Trail, Strawberry River Day Use Area, Aspen Grove Campground and Marina near Strawberry Reservoir, Sheep Creek Snowmobile Area, and Forest Service Road 090 (Sheep Creek Road) that largely parallels the transmission line, is a part of the Strawberry ATV System, and provides access to the Great Western Trail. Construction would adversely affect the non-mechanized user group (hikers, campers, and equestrians) that recreate on the trails listed above through construction activity and noise. Campers, day use area users, and boaters also would be adversely affected by construction activity and noise. Motorized drivers also would be adversely affected by construction if access to the trails listed above was altered. Use of the

trails and facilities may be altered if recreationists choose to visit other locations due to construction activities nearby.

During construction, wildlife may be displaced to areas that are not within the unit for which hunters are licensed. Construction would affect recreation use at these sites particularly on the weekends (Saturdays; there will be no construction on Sundays) and during the summer at higher elevation areas, and during the spring and fall at lower elevations. With the exception of hunters, who may not be able to follow wildlife to adjoining units, there are other nearby locations that visitors could temporarily go during construction activities that offer the same recreation opportunities in a similar environment. Application of **REC-5** and **REC-6** would reduce impacts to campers and day use area users by limiting construction on weekends and prohibiting activities on holidays or other key use times (such as the opening of big game seasons) near developed recreation sites and ensuring continued access to high use areas and trails.

Operation of the transmission line would affect the visual setting of recreational opportunities around the Aspen Grove Campground, the Strawberry River Day Use Area, and the trails listed above, as well as the access roads to these facilities. Non-motorized user groups such as hikers, campers, and picnickers may be affected by the presence of the transmission line; however, OHV user groups are not expected to be adversely affected by the presence of a transmission line (see Section 3.13.6). Project roads near the high use/developed areas listed above could result in unauthorized OHV use (and associated resource damage, noise, etc.) as well as permanent visual impacts. Please see Section 3.13.6.8 regarding potential impacts from Project access roads. Implementation of REC-2 would limit impacts from new access roads. Maintenance activities could displace wildlife, thus affecting hunting or wildlife viewing activities. Application of REC-1 would reduce this impact by scheduling maintenance activities outside of hunting seasons. Section 3.12, Visual Resources and Appendix I provide additional detail regarding visibility from the Uinta National Forest, as well as from the boat launch and campground areas, which are a KOP (V-34) used for visual analysis. The Strawberry IRA and Cedar Knoll IRA micro-siting options would not substantially affect the impact analysis for recreation.

Manti-La Sal National Forest. Within the Manti-La Sal National Forest, over 52 acres (67 percent) of the 250-foot-wide transmission line ROW and 3,592 acres (84 percent) of the 2-mile transmission line corridor would be located in areas classified as semi-primitive motorized. These acreages comprise 0.01 and 0.5 percent of all semi-primitive motorized areas within the Manti-La Sal National Forest, respectively. The sights and sounds of construction and presence of large construction crews and construction traffic would not be consistent with the recreation goals for these areas. Construction would adversely affect recreationists in these areas as described above. Approximately 2,156 acres of the semi-primitive motorized area within the 2-mile transmission line corridor would be located in IRAs. Using roadless construction methods would reduce some impacts to semi-primitive motorized areas by eliminating road construction; however, helicopter construction and/or overland travel itself also likely would result in a temporary adverse impact to recreationists in these areas. The remaining 1,436 acres of semi-primitive motorized area within the 2-mile transmission line corridor would be outside IRAs and comprise 0.2 percent of all areas classified as semi-primitive motorized within the Manti-La Sal National Forest.

Additionally, the route for the proposed 2-mile transmission line corridor would be partially located near the border of deer hunting units 16A and 12/16B/16C. During construction, wildlife may be displaced to areas that are not within the unit for which hunters are licensed. Construction would affect recreation use particularly on the weekends (Saturdays; there will be no construction on Sundays). Application of **REC-5** would reduce impacts to campers and hunters by prohibiting construction on weekends and on holidays or other key use times, such as opening days of hunting seasons, near developed recreation sites. Operation of the transmission line is not expected to affect recreational opportunities because, in general, the proposed transmission line would follow existing transmission lines. Maintenance

activities could displace wildlife, affecting hunting or wildlife viewing activities. Application of **REC-1** would reduce this impact by scheduling maintenance activities outside of hunting seasons.

### Other Federal Recreation Areas

<u>Dinosaur National Monument.</u> The 2-mile transmission line corridor for Alternative II-A encompasses 3 acres of the Dinosaur National Monument on the south side of Highway 40 across from Harpers Corner Road, which is the main entrance to the monument. The monument's visitor center and other facilities are located on the north side of Highway 40 on Harpers Corner Road, outside of the 2-mile transmission line corridor. Given that park facilities are located across the highway and up Harpers Corner Road, and the majority of the monument is located much further north, it is unlikely that any recreation use occurs south of Highway 40 and therefore impacts to recreation within the monument are unlikely.

#### State-managed Recreation Areas

<u>WMAs</u>. The 250-foot-wide transmission line ROW for Alternative II-A would cross eight WMAs/units; the 2-mile transmission line corridor also would include acreage in an additional two WMAs. All ten WMAs primarily are managed for big game and protection of big game winter habitat. Substantial portions of five WMAs would be within the 2-mile transmission line corridor:

- Tabby Mountain WMA—Rabbit Gulch Unit: 8,088 acres (89 percent) of the WMA;
- North Nebo WMA—Spencer Fork Unit: 6,265 acres (96 percent) of the WMA;
- Northwest Manti WMA—Birdseye/Lake Fork Unit: 2,695 acres (72 percent) of the WMA;
- South Nebo WMA—Triangle Ranch Unit: 1,855 acres (38 percent) of the WMA; and
- Nephi WMA—Nephi Unit: 152 acres (100 percent) of the WMA.

Ten to 15 percent of the Northwest Manti WMA – Dairy Fork Unit, Currant Creek/Wildcat WMA, and Strawberry River WMA would be within the 2-mile transmission line corridor.

Two percent or less of the remaining two WMAs (Tabby Mountain WMA – Tabby Mountain Unit and Northwest Manti WMA – Lasson Draw) would be within the 2-mile transmission line corridor.

The acreage within the 2-mile transmission corridor represents the maximum area that could be temporarily removed from use as wildlife habitat and quality hunting area due to surface disturbance, increased noise, and human activity, and would encompass substantial portions of five WMAs. With the exception of the Currant Creek/Wildcat, Nephi, and Strawberry River WMAs, all of these units are closed to public access in winter and spring to protect wintering wildlife. Adherence to timing restrictions during both construction and operation phases would prevent disturbance to wintering big game; however, there would still be some loss of big game habitat through vegetation removal, noise and human activity. These impacts within the WMAs primarily would affect hunting and wildlife watching recreation opportunities.

Agreements for four of these WMAs contain language that could prohibit development of a transmission line and/or access roads if impacts are not sufficiently mitigated. The conservation agreement language for the North Nebo WMA—Spencer Fork Unit specifically precludes industrial, commercial, or other development that is not consistent with the conservation values and purpose of the WMA. The South Nebo WMA—Triangle Ranch Unit contains a reversionary clause on some parcels if land use changes from "big game management." As CUP mitigation properties, the Currant Creek/Wildcat and Strawberry River WMAs, also have reversionary clauses that require them to manage the properties for the purposes for which they were acquired. Additionally, the Tabby Mountain WMA is adjoined by a private conservation easement area (Sand Wash/Sink Draw) that prohibits development of overhead transmission lines (see Section 3.14, Land Use). Development of a

3.13-61

transmission line or access roads within these WMAs would therefore not be in conformance with area management.

Habitat loss would be minimized through application of REC-2, which would limit access to existing roads within the WMA and/or require full reclamation of any roads that are constructed. Application of REC-4 would reduce recreation impacts by rescheduling construction activities within key hunting locales, such as WMAs, outside of hunting seasons. During operations, the 250-foot-wide transmission line ROW would still have some level of vegetation maintenance during operations that could affect wildlife habitat, and maintenance-related noise could temporarily affect adjacent hunting and wildlife viewing opportunities by making the area less hospitable for wildlife. Application of REC-1 (scheduling vegetation maintenance outside of big game hunting seasons where practicable) would further minimize impacts to hunting and wildlife viewing.

CWMUs. The 250-foot-wide transmission line ROW for Alternative II-A also would cross the 6,390-acre Double R Ranch CWMU. Approximately 40 acres would be within the 250-foot-wide transmission line ROW; the 2-mile transmission line corridor would encompass 2,465 acres (40 percent) of the CWMU. Approximately 200 acres of the 2-mile transmission line corridor also would be within the 10,409-acre Crab Ranch CWMU. Impacts to hunting within the 2-mile transmission line corridor area would be similar to those described above. Decisions regarding road construction and timing of construction would be up to the private landowner.

Starvation State Park. The 2-mile transmission line corridor crosses approximately 459 acres of the 7,324-acre Starvation State Park. This park offers boating and other water sports at Starvation Reservoir and features a developed camping area as well as undeveloped camping areas. The 2-mile transmission line corridor would be located on the reservoir side that is opposite of the developed camping areas, but would be near the Rabbit Gulch primitive camping area. Campers in this area would be most disturbed by the sights and sounds of construction. There are other primitive camping areas located around the reservoir that could be used by any displaced campers from Rabbit Gulch. Scenic views are not anticipated to be highly affected as the area is already disturbed by oil and gas wells and the existing steel lattice structures of an existing transmission line. Section 3.12, Visual Resources, and **Appendix I** provide additional detail regarding visibility.

### Local Recreation Areas

Big Mountain Campground. The 2-mile transmission line corridor would encompass approximately 15 acres of the Big Mountain Campground (the entire site), a private campground off Highway 132 in Nephi. Construction would affect camping in this area through noise and visual disturbances. There would be many other camping areas on nearby NFS lands that would not be affected and would continue to be available for use during construction. Section 3.17, Social and Economic Conditions, addresses the economic impacts of construction on this facility. Section 3.12, Visual Resources, and Appendix I provide additional detail regarding visibility from a key observation point (KOP) F-2, which is located near the campground.

Application of REC-2 would limit access to existing roads and/or require full reclamation of any new roads. Application of REC-5 and REC-6 would reduce impacts to campers by prohibiting construction during weekends and other high use periods and maintaining access to high use areas.

Bottle Hollow and Brough Reservoirs. The 2-mile transmission line corridor also would cross Brough Reservoir, a blue ribbon trout fishing area, and Bottle Hollow Reservoir, a reservoir managed by the Uintah and Ouray Indian Reservation. Construction is not expected to impact fishing in these areas: however, restricted access would be an adverse impact to recreational users.

Application of **REC-6** would be effective in reducing impacts to the users of these areas by ensuring continued access, though there could be some traffic delays accessing recreational areas. Section

Draft FIS June 2013 3.12, Visual Resources, and Appendix I provide additional detail regarding visibility from KOP V-21, which is located near Bottle Hollow Reservoir.

### Scenic Backways and Byways

<u>Dinosaur Diamond Prehistoric Byway</u>. Within Region II, the 250-foot-wide transmission line ROW for Alternative II-A would cross the 480-mile Dinosaur Diamond Prehistoric Byway (Highway 40/191) south of Roosevelt, Utah and again near Dinosaur, Colorado. Approximately five miles of the Byway would be located within the 2-mile transmission line corridor in which roads and other construction facilities would be located. During construction, scenic drivers would be adversely affected by construction activities near the highway. Other impacts would include temporary traffic delays due to construction during key construction times (such as stringing of the lines). No impacts from operation are expected because the area near Roosevelt, in which the transmission line would be visible from the Byway, is a rural area where transmission lines and other manmade structures are already visible; and the portion of the 2-mile transmission line corridor near Dinosaur, Colorado would follow an existing transmission line. Section 3.12, Visual Resources, and **Appendix I** provide additional detail regarding visibility along the Byway.

White River/Strawberry Road Scenic Backway. Within the Uinta National Forest, the 250-foot-wide transmission line ROW would cross the 28-mile White River/Strawberry Road Scenic Backway near Strawberry Reservoir. Approximately three miles of the Backway would be within the 2-mile transmission line corridor in which roads and other construction facilities would be located. The visual disturbances created by the transmission line itself would permanently alter the recreation setting for scenic driving on portions of the Scenic Backway nearest to the 250-foot-wide transmission line ROW; scenic drivers using the Backway also could be subject to views of road construction within the 2-mile transmission line corridor (see Section 3.12, Visual Resources, for more information). Section 3.12, Visual Resources, and Appendix I provide additional detail regarding visibility along the backway.

Nebo Loop Scenic Byway. East of Nephi, the transmission line would be located on the south side of Highway 132, opposite the turnoff for the 37-mile Nebo Loop Scenic Byway (Salt Creek Canyon Road). Less than 1 mile of the Byway would be within the 2-mile transmission line corridor; scenic drivers would see construction areas as they enter/leave the Byway. Section 3.12, Visual Resources, and Appendix I provide additional detail regarding visibility along the Byway and conformance with visual objectives in this area. East of the Byway, the transmission line would cross Highway 132, potentially causing some traffic delays for those accessing the Byway during key construction periods.

### Alternative II-B

Alternative II-B would cross dispersed recreation areas in seven FOs and two national forests (including several developed recreation sites), three specially managed recreation areas, and two WMAs. Alternative II-B also would affect three scenic byways.

### BLM Dispersed Recreation Areas

Within Region II, the 250-foot-wide transmission line ROW for Alternative II-B would impact seven FOs. The 2-mile transmission line corridor for Alternative II-B, which represents the maximum area that could be temporarily removed from use during construction due to surface disturbance, increased noise, and human activity, would encompass the following acreages of dispersed area within each FO:

- White River FO: 57,802 acres (4.0 percent of total available acreage for dispersed recreation within the FO).
- Grand Junction: 32,592 acres (2.5 percent of total available acreage for dispersed recreation within the FO).

- Vernal FO: 5,151 acres (0.3 percent of total available acreage for dispersed recreation within the FO).
- Moab FO: 69,151 acres (5.8 percent of total available acreage for dispersed recreation within the FO).
- Price FO: 68,221 acres (5.0 percent of total available acreage for dispersed recreation within the FO).
- Richfield FO: 5,821 acres (0.5 percent of total available acreage for dispersed recreation within the FO).
- Fillmore FO: 21,815 acres (0.5 percent of total available acreage for dispersed recreation within the FO).

Construction impacts within the White River, Vernal, Richfield, and Fillmore FOs would be similar to those identified under Alternative II-A, but would vary in intensity based on acreage and would affect different portions of the FO. There are no areas of high use identified within the dispersed recreation areas for these FOs and there are public lands adjacent to the affected areas that can accommodate any displaced dispersed recreation activities. Within the Grand Junction and Price FOs, recreation use within the 2-mile transmission line corridor is likely to include OHV use, hunting, recreational shooting, and other dispersed recreation activities. There are no identified high use areas within these portions of the FOs.

Within the Moab FO, acreage within the 2-mile transmission line corridor primarily would be along the Highway 70/6/50 corridor. With the exception of scenic driving, this is not a high use recreation area, and there are public lands adjacent to affected areas that can accommodate any displaced recreation activities. The 250-foot-wide transmission line ROW would be partially in a designated utility corridor and partially within ROW avoidance areas, and would cross the highway once. Construction of the transmission line (and accompanying roads or construction support areas) would alter the scenic quality and recreation setting for scenic drivers on the highway. Wire installation across the highway would cause temporary delays in traffic. Section 3.12, Visual Resources, and **Appendix I** provide additional detail regarding visibility from Highway 70.

## BLM SRMAs or Other Specially Managed Recreation Areas

Labyrinth Canyon/Gemini Bridges SRMA. Within the Moab FO, approximately 75 acres of the 250-foot-wide transmission line ROW and 4,807 acres of the 2-mile transmission line corridor would fall within the 300,600-acre Labyrinth Canyon/Gemini Bridges SRMA. These acreages comprise 0.02 percent and 1.4 percent of the SRMA, respectively. This SRMA is managed to provide destination recreation including river running, camping, mountain biking and other recreation opportunities. Within the SRMA, the transmission line would be within a designated utility corridor and in conformance with area management. The portion of the SRMA impacted by the transmission line is the far northern end, near Highway 6/50, and would not be expected to be a high use area for hiking, camping, and other non-motorized activities. However, any construction activity would be an adverse impact to river users entering the SRMA in this area.

<u>Labyrinth Canyon SRMA</u>. Within the Price FO, approximately 154 acres of the Labyrinth Canyon SRMA (less than 0.5 percent of the SRMA) would be within the 2-mile transmission line corridor. Impacts to recreation within this area would be similar to those described for the Labyrinth Canyon/Gemini Bridges SRMA due to its location along the Green River.

<u>Utah Rims SRMA</u>. Approximately 925 acres of the 2-mile transmission line corridor would fall within the 15,424-acre Utah Rims SRMA. This acreage comprises 6.0 percent of the SRMA. The SRMA is managed to provide a variety of community-based dispersed, motorized recreation opportunities (primarily OHV use). It is assumed that the aesthetic impacts from construction or operation of the

transmission line would not substantively affect recreational use of the OHV trails, due to the noise of the motorized vehicles used on the trail system; however, other user groups such as campers located within the 2-mile transmission line corridor would be adversely affected by the construction noise and activity. Restricted access to the trail system during construction would be an adverse impact for recreational users in this area. Application of **REC-6** would reduce impacts to recreational users in this area by allowing users continued access to all or part of the trail system.

#### USFS Recreation Areas

Within Region II, Alternative II-B would impact dispersed recreation areas in the Manti-La Sal National Forest and the Fishlake National Forest.

Manti-La Sal National Forest. Approximately 536 acres of the 250-foot-wide transmission line ROW and 21,944 acres of the 2-mile transmission line corridor would fall within the Manti-La Sal National Forest. Over 70 percent of the acreage within the 250-foot-wide transmission line ROW would fall exclusively within areas classified as roaded natural. These types of areas are managed for recreation in ways that allow for readily evident to moderate evidence of the sights and sounds of human activity. The sights and sounds of construction would be in conformance with area management, though they would cause temporary adverse impacts to scenic viewers, hikers, campers and other non-motorized user groups identified in Section 3.13.6. Areas classified as semi-primitive motorized, while having some evidence of other users and motorized use, have a low concentration of users and a predominantly natural or natural-appearing environment. Approximately 7,555 acres within the 2-mile transmission line corridor would be classified as semi-primitive motorized. This is 34 percent of the total acreage of the 2-mile transmission line corridor located within the Manti-La Sal National Forest (26,584 acres) and 1.0 percent of all semi-primitive motorized acreage within the Manti-La Sal National Forest. The total acreage within the 2-mile transmission line corridor represents the maximum area that could be temporarily removed from use during construction due to surface disturbance, increased noise, and human activity. Approximately 10 acres (0.1 percent) of the total acreage of the 2-mile transmission line corridor would be within areas classified as semi-primitive non-motorized. This acreage comprises 0.01 percent of all semi-primitive non-motorized ROS acreage within the Manti-La Sal National Forest. The sights and sounds of construction and presence of large construction crews and construction traffic would not be consistent with the recreation goals for these areas. Over 40 percent of acreage within the 2-mile transmission line corridor in areas classified as semi-primitive motorized (or 3,121 acres) and all of the acreage within semi-primitive non-motorized areas would be located within IRAs. Construction within IRAs would use roadless construction methods identified in Appendix D. This would reduce some impacts to semi-primitive motorized and non-motorized areas by eliminating road construction; however, helicopter construction and/or overland travel itself also likely would be a temporary adverse impact to recreationists in these areas. The remaining 4,434 acres of semi-primitive motorized area within the 2-mile transmission line corridor would be outside IRAs and comprise 0.6 percent of all areas classified as semi-primitive motorized within the Manti-La Sal National Forest.

As discussed in Section 3.13.6, construction would adversely affect the hunter and wildlife viewer user group through habitat removal, restricted access to areas undergoing construction, and by displacing wildlife in and near construction zones. Construction also would adversely affect the non-mechanized user group (hikers, campers, and equestrians) through construction activity and noise. During construction, wildlife may be displaced to areas that are not within the unit for which hunters are licensed. Hunters would be adversely impacted only if these activities were scheduled during active hunting seasons. The majority of this route is well within Hunt Unit 12 and therefore not likely to affect hunters' ability to track displaced game. Recreationists seeking wildlife watching experiences or natural settings would be adversely impacted by construction activities regardless of their timing.

Within the Manti-La Sal National Forest, Alternative II-B would cross several high use/developed areas, including the Arapeen ATV Trail System area, Indian Creek Group Campground, and Potters

Pond Campground. Alternative II-B would cross almost all of the OHV routes within the northern part of the Arapeen ATV Trail System, including the Great Western Trail. The Great Western Trail is one of the few long distance north/south trails in this area. Restricted access to the trail during the summer would be a substantial, but temporary adverse impact to both motorized and non-motorized user groups. Application of **REC-6** would allow access to the trail to continue, although there could be delays in use during key construction times. Use of other OHV routes also would be affected from construction activities potentially altering the ability of users to drive on the route through construction areas. However, use of mainly small loop routes would be affected; routes of similar difficulty and length would be available for use in the southern part of the trail system (USFS 2010a). Construction activities related to Alternative II-B also would affect use of the Indian Creek Group Campground and Potter's Pond Campground as campers may choose alternate locations to avoid construction activities and noise. Other nearby dispersed campsites on Miller Flat Road would continue to be available for use during construction activities. Application of **REC-5** and **REC-6** would reduce impacts to campers by limiting construction on weekends and prohibiting activities on holidays or other key use times near developed recreation sites and ensuring continued access to high use areas.

Operation of the transmission line also would affect the visual setting of recreation opportunities and access roads, although in general, the line follows an existing high voltage wooden H-frame transmission line. Non-motorized users such as hikers may be affected by presence of the transmission line; however, OHV users are not expected to be adversely affected by the presence of the transmission line (see Section 3.13.6). Project roads near the high use/developed areas listed above could result in unauthorized OHV use (and associated resource damage, noise, etc.) as well as permanent visual impacts. Please see Section 3.13.6.8 regarding potential impacts from Project access roads. Implementation of REC-2 would limit impacts from new access roads. Maintenance activities could displace wildlife, thus affecting hunting or wildlife viewing activities. Application of REC-1 would reduce this impact by scheduling maintenance activities outside of hunting seasons. Section 3.12, Visual Resources, and Appendix I provide additional detail regarding visibility from KOPs P-16 and P-17, which are located at the Indian Creek and Potter's Pond campgrounds. Operation and maintenance noise and activities could displace wildlife, affecting hunting or wildlife viewing activities. Application of REC-1 would reduce this impact, by scheduling maintenance activities outside of hunting seasons.

Fishlake National Forest. Approximately 116 acres of the 250-foot-wide transmission line ROW would fall within areas classified as roaded natural within the Fishlake National Forest. The 2-mile transmission line corridor for Alternative II-B, which represents the maximum area that could be temporarily removed from use during construction due to surface disturbance, increased noise, and human activity, would encompass 4,129 acres of the Fishlake National Forest. Thirty-seven percent of this acreage (1,534 acres) would be within areas classified as semi-primitive motorized. This acreage, which comprises 0.1 percent of all semi-primitive motorized acreage within the Fishlake National Forest, would not be in conformance with recreation goals for this ROS classification. None of this acreage would be within IRAs. Impacts to recreation within the Fishlake National Forest from construction would be similar to those discussed for national forests under Alternative II-A, and above. There are no identified high use areas within this portion of the Fishlake National Forest; however, the proposed 2-mile transmission line corridor would be partially located near the northern edge of a UDWR limited entry hunt unit (16A). Construction during hunting season within or near this unit would adversely affect hunters through habitat removal, restricted access to areas undergoing construction, and by displacing wildlife in and near construction zones. Hunters may not be able to easily move to other areas to follow wildlife movement, and wildlife may be displaced to areas that are not within the unit. Additionally, the limited entry nature of this unit is such that it would be difficult to find a substitute hunting opportunity. Application of mitigation measures REC-1, REC-2, REC-4, and REC-5 would assist in reducing impacts within the hunting unit during both construction and operation. Operation of the transmission line also would affect the visual setting of dispersed recreational opportunities although in general, the line follows existing transmission lines.

## State-managed Recreation Areas

WMAs. The 250-foot-wide transmission line ROW for Alternative II-B would cross the South Nebo WMA – Triangle Ranch Unit and the Moroni subunit of the North Nebo WMA – Fountain Green Unit. Both WMAs are managed to protect big game winter range. Impacts to the South Nebo WMA – Triangle Ranch Unit would be similar to those identified under Alternative II-A, but would affect a greater portion of the WMA (the 2-mile transmission line corridor would encompass approximately 2,734 acres or 56 percent of the WMA). Approximately 41 acres of the 250-foot-wide transmission line ROW and 1,347 acres of the 2-mile transmission line corridor would fall within the North Nebo – Fountain Green Unit. This comprises 2 percent and 58 percent of the WMA, respectively. The unit is closed to public access in winter and spring to protect wintering wildlife. Adherence to timing restrictions during both construction and operation phases would prevent disturbance to wintering big game; however, there would still be some loss of big game habitat through vegetation removal, noise, and human activity that would affect hunting and wildlife watching recreation opportunities.

The South Nebo WMA —Triangle Ranch Unit contains reversionary clauses on some parcels if land use changes from "big game management." Development of a transmission line or access roads within these parcels would not be in conformance with area management. Habitat loss would be minimized through application of **REC-2**, which would limit access to existing roads within the WMA and/or require full reclamation of any roads that are constructed. Application of **REC-4** would reduce recreational impacts by rescheduling construction activities within key hunting locales, such as WMAs, outside of hunting seasons. During operations, the 250-foot-wide transmission line ROW would still have some level of vegetation maintenance during operations that could affect wildlife habitat, and maintenance-related noise could temporarily affect adjacent hunting and wildlife viewing opportunities by making the area less hospitable for wildlife. Application of **REC-1** (scheduling vegetation maintenance outside of big game hunting seasons where practicable) would further minimize impacts to hunting and wildlife viewing.

<u>CWMUs</u>. The 250-foot-wide transmission line ROW for Alternative II-B also would cross the 8,037-acre Bear Mountain CWMU. Approximately 82 acres would be within the 250-foot-wide ROW; the 2-mile transmission line corridor would encompass 4,515 acres (56 percent) of the CWMU. Impacts to hunting within the 2-mile transmission line corridor area would be similar to those described above. Decisions regarding road construction and timing of construction would be up to the private landowner.

# Local Recreation Areas

Bear Creek Campground. Approximately 18 acres of Emery County's Bear Creek Campground (the entire site) would be located within the 2-mile transmission line corridor; the campground would not be located within the 250-foot-wide transmission line ROW. Construction within the 2-mile transmission line corridor would adversely affect campers, particularly during summer weekends, due to construction activity and noise. Recreation use of the campground also may be affected if campers are displaced to nearby campgrounds in the Manti-La Sal National Forest. Application of **REC-2** would limit access to existing roads and/or require full reclamation of any new roads. Application of **REC-5** and **REC-6** would reduce impacts to campers by prohibiting construction during weekends and other high use periods and maintaining access to high use recreation areas. Section 3.12, Visual Resources, and **Appendix I** provide additional detail regarding visibility from KOP P-32, which is located near the campground.

<u>Cedar Ridges Golf Course</u>. The entire Cedar Ridges Golf Course near Rangely, Colorado would be located within the 2-mile transmission line corridor; however, the golf course would not be located within the 250-foot-wide transmission line ROW. Construction activity and noise within the 2-mile transmission line corridor would adversely affect golfers, as well as use of the golf course, particularly during the summer, if golfers are displaced to another location. Application of **REC-2** would limit access to existing roads and/or require full reclamation of any new roads. Application of **REC-5** and

**REC-6** would reduce impacts to golfers by prohibiting construction during weekends and other high use periods and maintaining access to high use recreation areas.

### Scenic Backways and Byways

Dinosaur Diamond Prehistoric Byway. Under Alternative II-B, the 250-foot-wide transmission line ROW for Alternative II-B would largely parallel the 480-mile Dinosaur Diamond Prehistoric Byway along the Highway 70/6/50 corridor between the McInnis NCA and Green River, Utah and along Highway 6 between Green River and Price. Over 88 miles of the Byway would fall within the 2-mile transmission line corridor in which roads and other construction facilities would be located. Impacts would include temporary traffic delays due to construction during key construction times (such as stringing of the lines), and alteration of the recreation setting for scenic drivers along these portions of the Byway. However, both affected portions of the Byway have existing transmission lines adjacent to the highway. Section 3.12, Visual Resources, and **Appendix I** provide additional detail regarding visibility along the Byway.

Energy Loop: Huntington/Eccles Canyons Scenic Byway. West of Huntington, the 250-foot-wide transmission line ROW would cross the 83-mile Energy Loop: Huntington/Eccles Canyons Scenic Byway (SR-31), and generally would parallel the Byway for about 4 miles, although the 250-foot-wide transmission line ROW would be located about 1.5 miles to the south of SR 31. Approximately 4 miles of the Byway would fall within the 2-mile transmission line corridor; about 1 mile of the Byway would fall within the 250-foot-wide transmission line ROW. Construction activity at the crossing or road construction within the portion of the 2-mile transmission line corridor adjoining the Byway would adversely affect the scenic view of the Byway. Visual disturbances from construction of new roads would be permanent unless fully restored. During construction, portions of the Byway also could experience additional traffic on segments used for employee commute, supply delivery, etc. (see Section 3.16, Transportation). Section 3.12, Visual Resources, and **Appendix I** provide additional detail regarding visibility along the Byway.

Skyline Drive Scenic Backway. Southwest of Mt. Pleasant, the 250-foot-wide transmission line ROW would cross Skyline Drive Scenic Backway; approximately 3 miles of the Backway would be within the 2-mile transmission line corridor. There are existing transmission lines in this area. Scenic drivers using the Backway could be subject to views of road construction within the 2-mile transmission line corridor (see Section 3.12, Visual Resources, and **Appendix I** for more information on visual impacts to the Backway). Visual disturbances from construction of new roads would be permanent unless fully restored. During construction, portions of the Backway also could experience additional traffic on segments used for employee commute, supply delivery, etc. (see Section 3.16, Transportation and Access).

# Alternative II-C

Alternative II-C would cross dispersed recreation areas in seven FOs and one national forest (including several developed recreation sites), four specially managed recreation areas and two WMAs. Alternative II-C also would affect three scenic backways/byways.

# BLM Dispersed Recreation Areas

Under Alternative II-C, impacts to the White River, Grand Junction, Moab, and Vernal FOs would be the same as under Alternative II-B. Impacts within the Price and Fillmore FOs would affect similar amounts of dispersed recreation area as Alternative II-B, although in different locations. There are no high use areas identified within the analysis area for this alternative.

The Richfield FO would have 436 acres (0.03 percent) of dispersed recreation area within the 250-foot-wide transmission line ROW and 16,289 acres within the 2-mile transmission line corridor. There are no identified high use areas within this acreage.

## BLM SRMAs or Other Specially Managed Recreation Areas

Within the Moab FO, impacts to the Utah Rims and Labyrinth/Gemini Bridges SRMAs would be the same as under Alternative II-B. Within the Price FO, impacts to the Labyrinth SRMA would be the same as under Alternative II-B.

San Rafael Swell SRMA. Within the Price FO, approximately 180 acres of the 250-foot-wide transmission line ROW and 10,589 acres of the 2-mile transmission line corridor would fall within the 938,500-acre San Rafael Swell SRMA. These acreages comprise 0.02 percent and 1.1 percent of the SRMA, respectively. This SRMA is managed to provide sightseeing, OHV use, mountain biking, horseback riding, hiking, wildlife viewing, visiting cultural sites, camping, picnicking, photography, rock hounding, snowmobiling, and hunting opportunities. Most of the SRMA, including the more popular areas to the south, would not be affected and other day use sites and OHV routes would continue to be available during construction activities (BLM 2011e,f).

### USFS Recreation Areas

Fishlake National Forest. Under Alternative II-C, 476 acres of the 250-foot-wide transmission line ROW would fall within areas classified as roaded natural within the Fishlake National Forest. The sights and sounds of construction would be in conformance with area management, though it would cause temporary adverse impacts to scenic viewers, hikers, campers and other non-motorized users identified in Section 3.13.6. Areas classified as semi-primitive motorized, while having some evidence of other users and motorized use, have a low concentration of users, and a predominantly natural or natural-appearing environment. Approximately 400 acres of the 250-foot-wide transmission line ROW and 18,887 acres of the 2-mile transmission line corridor would be located in areas classified as semi-primitive motorized. This is 46 percent of the total acreage of 2-mile transmission line corridor located within the Fishlake National Forest (40,825 acres) and 1.8 percent of all areas classified as semi-primitive motorized within the Fishlake National Forest. The total acreage within the 2-mile transmission line corridor represents the maximum area that could be temporarily removed from use during construction due to surface disturbance, increased noise, and human activity. Approximately 111 acres of the 2-mile transmission line corridor would be within areas classified as semi-primitive non-motorized. This is 0.06 percent of all semi-primitive non-motorized acreage within the Fishlake National Forest. The sights and sounds of construction and presence of large construction crews and construction traffic would not be consistent with the recreation goals for this ROS classification. Approximately 1,151 acres of the 18,887 acres within semi-primitive motorized areas within the 2-mile transmission line corridor and 89 acres of the 111 acres within semi-primitive non-motorized areas would be located within IRAs. Roadless construction methods (see Appendix D) would reduce some impacts to semi-primitive motorized and non-motorized areas by eliminating road construction, but could cause a temporary adverse impact to recreationists through helicopter noise and other disturbances. The remaining 17,736 acres of semi-primitive motorized area within the 2-mile transmission line corridor would be outside the IRAs and comprises approximately 1.7 percent of all semi-primitive motorized acreage within the Fishlake National Forest. The remaining 21 acres of semi-primitive non-motorized area within the 2-mile transmission line corridor would be less than 0.01 percent of all semi-primitive non-motorized areas within the Fishlake National Forest.

Impacts to recreation in national forests from construction would be similar to those discussed under Alternative II-A. Identified high use areas within the Fishlake National Forest in Alternative II-C include the Great Western Trail, Gooseberry ATV Trail, Gooseberry-Fishlake Trail, and Great Western/Paiute ATV Trail, which is rated one of the top OHV trails in the country (Utah.com 2011b). The Great Western Trail is one of the few long distance north/south trails in this area. Temporary closure of the Great Western/Paiute ATV Trail during the summer would cause significant, inconvenient bypassing of the closures and would limit north/south travel on two of the long distance north/south trails in this area during the recreation season. Restricted access to the trail during the summer would be a substantial, but temporary adverse impact to both motorized and non-motorized user groups. Although other OHV routes would be affected in the three sections of the National Forest, there are many other similar

routes that would continue to be available for use in the National Forest during construction (USFS 2010b). Application of REC-6 would allow access to the Great Western/Paiute Trail to continue, although there could be delays in use during key construction times.

Construction activities related to Alternative II-C would affect use of the Maple Grove picnic area and campground, which are located near the analysis area; the transmission line corridor would cross the access road to the campground. Application of REC-6 would allow access to the Maple Grove sites to continue, although picnickers and campers may experience some delays in accessing the Maple Grove sites during key construction times. Section 3.12, Visual Resources, and Appendix I identify visual impacts to the area that can be viewed from the campground (KOP F-23). Application of REC-5 would reduce impacts to campers by limiting construction on weekends and prohibiting activities on holidays or other key use times near developed recreation sites.

Project roads near the high use/developed areas listed above could result in unauthorized OHV use (and associated resource damage, noise, etc.) as well as permanent visual impacts. Please see Section 3.13.6.8 regarding potential impacts from Project access roads. Implementation of REC-2 would limit impacts from new access roads. Operations and maintenance activities could displace wildlife, thus affecting hunting or wildlife viewing activities. Application of REC-1 would reduce this impact by scheduling maintenance activities outside of hunting seasons. Operation of the transmission line also would affect the visual setting of recreation opportunities, although in general the line follows existing transmission lines.

## State-managed Recreation Areas

WMAs. Under Alternative II-C, approximately 221 acres of the 2-mile transmission line corridor would fall within the Fillmore WMA. This comprises 1.7 percent of the WMA. The Fillmore WMA is composed of several fenced parcels managed to provide protection to big game winter range. The area is closed in winter and spring to protect wintering big game habitat. Impacts would be similar to those identified under other WMAs and would be fully eliminated or minimized through avoidance of the WMA for road construction and support area placement (REC-2). If road construction could not be avoided, application of **REC-4** would reduce recreation impacts by rescheduling construction activities within key hunting locales, such as WMAs, to be outside of hunting seasons.

Additionally, there is a very small portion (less than 1 acre) of the 2-mile transmission line corridor that is located within the 80-acre Emery Farm Castle Dale WMA. Impacts would be fully eliminated or minimized through avoidance of the WMA for road construction and support area placement (REC-2).

<u>CWMUs</u>. The 250-foot-wide transmission line ROW for Alternative II-C also would cross five CWMUs. The 2-mile transmission line corridor would encompass over 50 percent of the 10,558-acre Castle Valley Outdoors CWMU and the 7,975-acre Round Valley CWMU and approximately 17 percent of the 13,330-acre Johnson Mountain Ranch CWMU. Between 2 and 4 percent of the 4,670-acre Oak Ranch CWMU and the 8,165-acre Old Woman Plateau CWMU also would be within the 2-mile transmission line corridor. Impacts to hunting within the 2-mile transmission line corridor would be similar to those described above. Decisions regarding road construction and timing of construction would be up to the private landowner.

## Local Recreation Areas

Cedar Ridges Golf Course. Impacts for Alternative II-C would be the same as those described under Alternative II-B for the Cedar Ridges Golf Course.

### Scenic Backways and Byways

Wedge Overlook/Buckhorn Drive Scenic Backway. The 250-foot-wide transmission line ROW for Alternative II-C would parallel several portions of the Wedge Overlook/Buckhorn Drive Scenic

Draft FIS June 2013 Backway, crossing the Backway five times. Approximately nine miles of the Backway would be within the 2-mile transmission line corridor. The visual disturbances created by the transmission line itself would permanently alter the recreation setting for scenic driving on portions of the Backway. Section 3.12, Visual Resources, and **Appendix I** provide additional detail regarding visibility along the Backway (KOPs P-9 and P-10). During construction, scenic drivers using the Backway would be subject to views of transmission line and access road construction and could experience traffic delays on portions of the Backway used for employee commute. Wire installation across the road would cause temporary delays in traffic.

Gooseberry-Fremont Road Scenic Backway. The 250-foot-wide transmission line ROW for Alternative II-C also would cross the Gooseberry-Fremont Road Scenic Backway about 3 miles south of its terminus at US 70/SR 6 and would parallel an existing transmission line. Approximately 2 miles of the Backway would be within the 2-mile transmission line corridor. During construction, scenic drivers using the Backway would be subject to views of transmission line and access road construction. Drivers also could experience additional traffic on portions of the Backway used for employee commute. Wire installation across the road would cause temporary delays in traffic. Operation of the transmission line could affect the visual setting for scenic drivers, although there is an existing transmission line along this portion of the Backway. Section 3.12, Visual Resources, and Appendix I provide additional detail regarding visibility along the Backway (KOPs Rich-14 and Rich-15).

<u>Dinosaur Diamond Prehistoric Byway</u>. Impacts to the Dinosaur Diamond Prehistoric Byway would be similar to those described under Alternative II-B because the two alternatives largely share the same route

Section 3.12, Visual Resources, contains additional information regarding impacts to Scenic Byways and Backways.

# Alternative II-D

Alternative II-D would cross dispersed recreation areas in five FOs and three national forests (including several developed recreation sites), three specially managed recreation areas, and three WMAs. Alternative II-D also would affect four scenic byways and two backways.

## BLM Dispersed Recreation Areas

Within the White River and Fillmore FOs, the route for Alternative II-D largely shares the same corridor as Alternative II-A. Impacts to dispersed recreation within these two FOs would be similar to those described under Alternative II-A. Acreages are shown on **Table 3.13-23**.

Within the Vernal FO, the 250-foot-wide transmission line ROW for Alternative II-D would impact 2,337 acres of dispersed recreation area. The 2-mile transmission line corridor, which represents the maximum area that could be temporarily removed from use during construction due to surface disturbance, increased noise, and human activity, would encompass 89,284 acres of dispersed recreation area. These figures comprise 0.2 percent and 5.7 percent of acreage available for dispersed recreation in the FO, respectively. Within the Price FO, the 250-foot-wide transmission line ROW for Alternative II-D would impact 186 acres of dispersed recreation area and the 2-mile transmission line corridor would encompass 10,385 acres of dispersed recreation area. These figures comprise 0.01 percent and 0.8 percent of acreage available for dispersed recreation in the FO, respectively. Alternative II-D would cross the Green River at a location that has been identified as suitable for inclusion as "scenic" into the WSR system (see Section 3.15, Special Designations, for more information about compatibility with this designation). However, the more popular area for river recreation is the Desolation Canyon area, located downstream. Other high use recreational areas include Nine Mile Canyon and vacation home areas near Argyle Canyon. Within the Richfield FO, the 250-foot-wide transmission line ROW for Alternative II-D would impact 41 acres of dispersed

recreation area and the 2-mile transmission line corridor would encompass 1,574 acres of dispersed recreation activities (0.1 percent of the dispersed recreation area within the FO). Section 3.12, Visual Resources, and **Appendix I** provide additional detail regarding visibility along the access road to Sand Wash, the boating put-in for Desolation Canyon (KOP V-44), Nine Mile Canyon (V-45) and Argyle Canyon (V-46).

## BLM SRMAs or Other Specially Managed Recreation Areas

Fantasy Canyon and Nine Mile Canyon SRMAs. Within the Vernal FO, the 2-mile transmission line corridor would cross approximately 54 acres of the 69-acre Fantasy Canyon SRMA. This area, which comprises 78 percent of the SRMA, represents the maximum area that could be temporarily removed from use during construction due to surface disturbance, increased noise, and human activity. Construction would adversely affect self-guided tours and hiking areas within the SRMA. The 2-mile transmission line corridor would cross approximately 1,456 acres of the 44,168-acre Nine Mile Canyon SRMA. This area, which comprises 3 percent of the SRMA, is managed to protect high-value cultural tourism and high scenic quality for user groups such as recreational drivers and hikers. The 2-mile transmission line corridor would be located up above the rim, within oil and gas development areas and away from highly scenic areas and cultural resources; however, hikers and sightseers travelling through this area or recreating in this area would still be temporarily adversely affected by noise from construction activity within the 250-foot-wide transmission line ROW. Application of REC-2 within these SRMAs would minimize this impact by limiting access to existing roads within the SRMA and/or requiring full reclamation of any roads that are constructed.

<u>Little Sahara RA</u>. Within the Fillmore FO, impacts to the Little Sahara RA would be the same as described under Alternative II-A.

### USFS Recreation Areas

Ashley National Forest. Under Alternative II-D, approximately 11 acres of the 250-foot-wide transmission line ROW and 4,143 acres of the 2-mile transmission line corridor would fall within the Ashley National Forest. Over 90 percent of the 250-foot-wide transmission line ROW would fall exclusively within areas classified as roaded natural. These types of areas are managed for recreation in ways that allow for readily evident to moderate evidence of the sights and sounds of human activity. The sights and sounds of construction would be in conformance with area management, though construction would cause temporary adverse impacts to scenic viewers, hikers, campers and other non-motorized users identified in Section 3.13.6.

Approximately 2,629 acres within the 2-mile transmission line corridor would be located in areas classified as semi-primitive motorized. This is 64 percent of the total acreage of the 2-mile transmission line corridor located within the Ashley National Forest (4,143 acres) and comprises 0.9 percent of all semi-primitive motorized acreage within the Ashley National Forest. The total acreage within the 2-mile transmission line corridor represents the maximum area that could be temporarily removed from use during construction due to surface disturbance, increased noise, and human activity. Approximately 630 acres of the 2-mile transmission line corridor would be within areas classified as semi-primitive non-motorized. This acreage comprises 0.2 percent of all semi-primitive non-motorized acreage within the Ashley National Forest. The sights and sounds of construction and presence of large construction crews and construction traffic would not be consistent with the recreation goals for these areas. Over 99 percent of the 2-mile transmission line corridor acreage within semi-primitive motorized areas (or 2,623 acres) and 100 percent of the 630 acres within semi-primitive non-motorized areas would be located within IRAs. Roadless construction methods (see Appendix D) would reduce some impacts to semi-primitive motorized and non-motorized areas by eliminating road construction, but could cause a temporary adverse impact to recreationists through additional noise and disturbances. The remaining 5 acres of semi-primitive motorized areas within the 2-mile transmission line corridor would not be located in IRAs and comprises approximately less than 0.01 percent of all semi-primitive motorized acreage within the Ashley National Forest.

As discussed in Section 3.13.6, construction would adversely affect hunters and wildlife watcher user groups through habitat removal, restricted access to areas undergoing construction, and by displacing wildlife in and near construction zones. Construction also would adversely affect the non-mechanized user group (hikers, campers, and equestrians) that recreate in this area through construction activity and noise. The 2-mile transmission line corridor would cross areas where adjacent UDWR deer hunting units abut (units 10 and 11). During construction, wildlife may be displaced to areas that are not within the unit for which hunters are licensed. Unit 10 is a limited entry unit. The limited entry nature of this unit is such that it would be difficult to find a substitute hunting opportunity if wildlife were displaced from the unit. Application of mitigation measures **REC-2**, **REC-4**, and **REC-5** would assist in reducing impacts within this hunting unit during both construction and operation.

Construction would affect recreation use particularly on Saturdays (there will be no construction on Sundays) and during the summer at higher elevation areas, and during the spring and fall at lower elevations. Hunters would be adversely impacted only if construction activities were scheduled during active hunting seasons. Recreationists seeking wildlife watching experiences or natural settings would be adversely impacted by these activities regardless of their timing. There are no identified high use recreational areas within the portions of the Ashley National Forest affected by Alternative II-D and in general, there are other nearby locations that visitors could temporarily go during construction activities that offer the same recreation opportunities in a similar environment. Operation of the transmission line could affect the visual setting of dispersed recreation opportunities, but in general the transmission line follows existing transmission lines. Operation and maintenance activities could displace wildlife, affecting hunting or wildlife viewing activities. Application of mitigation measure REC-1 would assist in reducing impacts to hunting by scheduling vegetation maintenance activities outside of big game hunting seasons.

Manti-La Sal National Forest. Under Alternative II-D, approximately 173 acres of the 250-foot-wide transmission line ROW would fall within areas classified as roaded natural within the Manti-La Sal National Forest. The sights and sounds of construction would be in conformance with management goals of these areas, though construction would cause temporary adverse impacts to scenic viewers, hikers, campers and other non-motorized users identified in Section 3.13.6. Approximately 77 acres of the 250-foot-wide transmission line ROW would be located in areas classified as semi-primitive motorized. The 2-mile transmission line corridor for Alternative II-D, which represents the maximum area that could be temporarily removed from use during construction due to surface disturbance, increased noise, and human activity, would encompass 11,055 acres within the Ashley National Forest, 34 percent of which (3,727 acres) would be located in areas classified as semi-primitive motorized. This acreage comprises 0.5 percent of all semi-primitive motorized acreage within the Manti-La Sal National Forest. The sights and sounds of construction and presence of large construction crews and construction traffic would not be consistent with the recreation goals for these areas. Approximately 15 percent (or 574 acres) of the acreage in semi-primitive motorized areas would be located within IRAs. Roadless construction methods (see Appendix D) would reduce some impacts to semi-primitive motorized areas by eliminating road construction, but could cause a temporary adverse impact to recreationists through additional noise and disturbances. The remaining 3,153 acres of semi-primitive motorized areas would not be located in IRAs and comprises approximately 0.4 percent of all semi-primitive motorized acreage within the Manti-La Sal National Forest.

Impacts to recreation from construction would be similar to those discussed under Alternative II-A. Identified high use areas within the Manti-La Sal National Forest include the North Skyline Winter Staging Area, the Gooseberry Campground, Flat Canyon Campground, Boulger Reservoir, Electric Lake Reservoir, and Wasatch Academy. The North Skyline Winter Staging Area and Gooseberry Campground would be located within the 2-mile transmission line corridor and less than 0.5 miles from the 250-foot-wide transmission line ROW. The Wasatch Academy would be about a mile from the 250-foot-wide transmission line ROW. Small portions of Flat Canyon Campground, Boulger Reservoir, and Electric Lake Reservoir areas would be within the 2-mile transmission line corridor. Use of all of these

sites would be affected by construction noise and activities as visitors may choose to visit other locations or different portions of the reservoirs to avoid construction activities. Non-motorized users, including campers and hikers would be affected by construction noise and activities. Wasatch Academy is used year-round, but is most heavily used in the spring and fall when students participate in activities such as hiking, biking, skiing, snowboarding, snowshoeing, and other activities. Academy students and use of the Academy facilities would adversely be affected by construction noise and activities and Academy students would not have a substitute building location to use for Academy activities.

Operation of the transmission line would affect the visual setting of dispersed recreation opportunities. Project roads near the high use/developed areas listed above could result in unauthorized OHV use (and associated resource damage, noise, etc.) as well as permanent visual impacts. Please see Section 3.13.6.8 regarding potential impacts from Project access roads. Application of **REC-2**, **REC-5**, and **REC-6** would assist in reducing impacts to use of these high use areas and impacts to non-motorized users from construction and operation by limiting access to existing roads, closing or rehabilitating new access roads, limiting construction times, and ensuring access to high use areas and trails is not impeded. Operations and maintenance activities could displace wildlife, thus affecting hunting or wildlife viewing activities. Application of **REC-1** would reduce this impact by scheduling maintenance activities outside of hunting seasons. Application of **REC-7** would reduce impacts to the Academy by scheduling construction to minimize disturbance to students:

REC-7: Construction shall be scheduled to occur when the fewest students are at Wasatch Academy.

Section 3.12, Visual Resources, and **Appendix I** provide additional detail regarding visibility in this area (KOPs Rich-22—26, P-49 and P-50).

<u>Uinta National Forest</u>. Approximately 48 acres of the 2-mile transmission line corridor would fall exclusively within areas classified as roaded modified and roaded natural within the Uinta National Forest. These types of areas are managed for recreation in ways that allow for readily evident to moderate evidence of the sights and sounds of human activity. The sights and sounds of construction would be in conformance with area management, though construction would cause temporary adverse impacts to scenic viewers, hikers, campers and other non-motorized users identified in Section 3.13.6. In general, there are other nearby locations that visitors could temporarily go during construction activities that offer the same recreation opportunities in a similar environment. Operation of the transmission line could affect the visual setting of dispersed recreational opportunities, but in general the line follows existing transmission lines. Maintenance activities could displace wildlife, affecting hunting or wildlife viewing activities. Outside of scenic byways (discussed separately, below), there are no identified high use areas identified within the 2-mile transmission line corridor in Uinta National Forest.

#### Other Federal Recreation Areas

Impacts to the Dinosaur National Monument from Alternative II-D would be the same as those described under Alternative II-A.

#### State-managed Recreation Areas

WMAs. The 250-foot-wide transmission line ROW for Alternative II-D would cross the Gordon Creek WMA, Northwest Manti WMA – Hilltop Unit and the South Nebo WMA – Triangle Ranch Unit, affecting 155 acres, 17 acres and 61 acres in these WMAs, respectively. These acreages vary between 0.7 and 1.6 percent of the WMAs total acreages. These WMAs are managed for the protection of critical big game winter range. The Northwest Manti WMA – Hilltop Unit and South Nebo WMA – Triangle Ranch Unit are closed to public access in winter and spring to protect wintering wildlife. Adherence to timing restrictions during both construction and operation phases would prevent disturbance to wintering big game; however, there would still be some loss of big game habitat through vegetation removal, noise

and human activity. Alternative II-D within the WMAs primarily would affect hunting and wildlife watching recreation opportunities. The 2-mile transmission line corridor, which represents the maximum area that could be temporarily removed from use as wildlife habitat or hunting activities due to surface disturbance, increased noise, and human activity, would encompass substantial portions of the WMAs:

- Gordon Creek WMA: 5,315 acres (23.4 percent of total WMA acreage);
- Northwest Manti WMA Hilltop Unit: 696 acres (64.8 percent of total WMA acreage); and
- South Nebo WMA Triangle Ranch Unit: 3,584 acres (72.9 percent of total WMA acreage).

Agreements for the Gordon Creek WMA and South Nebo WMA – Triangle Ranch Unit contain reversionary clauses on some parcels if land use changes from "big game management." The Northwest Manti WMA – Hilltop Unit prohibits utilities, unless such structures or systems are necessary for permitted ranching operations or residential use. Development of a transmission line or access roads within these WMAs would not be in conformance with area management. Due to the conservation easement, application of mitigation measure **REC-8** would eliminate ground disturbance within the Hilltop Unit.

**REC-8**: Due to the conservation easement, there should be no ground disturbance within the Northwest Manti WMA-Hilltop Unit.

Habitat loss would be minimized through application of **REC-2**, which would limit access to existing roads within the WMA and/or require full reclamation of any roads that are constructed. Application of **REC-4** would reduce recreation impacts by rescheduling construction activities within key hunting locales, such as WMAs, to be outside of hunting seasons. During operations, the 250-foot-wide transmission line ROW would still have some level of vegetation maintenance during operations that could affect wildlife habitat, and maintenance-related noise could temporarily affect adjacent hunting and wildlife viewing opportunities by making the area less hospitable to wildlife. Application of **REC-1** (scheduling vegetation maintenance outside of big game hunting seasons where practicable) would further minimize impacts to hunting and wildlife viewing.

<u>CWMUs</u>. The 250-foot-wide transmission line ROW for Alternative II-D also would cross 63 percent (10,025 acres) of the 16,030-acre Minnie Maud Ridge CWMU and 1 percent (227 acres) of the 22,471-acre Emma Park CWMU. Impacts to hunting within the 2-mile transmission corridor area would be similar to those described above. Decisions regarding road construction and timing of construction would be up to the private landowner.

## Local Recreation Areas

<u>Big Mountain Campground</u>. Impacts for Alternative II-D would be the same as those described under Alternative II-A for the Big Mountain Campground.

## Scenic Backways and Byways

<u>Dinosaur Diamond Prehistoric Byway and Indian Canyon Scenic Byway</u>. The 250-foot-wide transmission line ROW for Alternative II-D would cross the Dinosaur Diamond Prehistoric Byway near Helper, Utah and again near Dinosaur, Colorado. Impacts to the Byway from the 5-mile portion of the transmission line route near Dinosaur would be the same as under Alternative II-A because the routes are the same. The route of the transmission line near Helper would largely parallel the Byway (SR 191) north of Helper; approximately 8 miles of the Byway would fall within the 2-mile transmission line corridor. This includes the portion of the area where the Bamberger roadside monument and Castle Gate Park are located. During construction, scenic drivers using the Byway would be subject to views of transmission line and access road construction. Drivers also could experience additional traffic on portions of the Byway used for employee commute; wire installation across the road would

cause temporary delays in traffic. Operation of the line is not expected to adversely affect scenic drivers as there are already existing transmission lines along this portion of the Byway. This portion of SR 191 also is part of the Indian Canyon Scenic Byway. Impacts to the Indian Canyon Scenic Byway would be the same as described above. Section 3.12, Visual Resources, and **Appendix I** provide additional detail regarding visual impacts to the Byway.

Nine Mile Canyon Scenic Backway. The 250-foot-wide transmission line ROW for Alternative II-D would cross the Nine Mile Canyon Scenic Backway. Approximately 2 miles of the Backway would be within the 2-mile transmission line corridor. The crossing would be above the rim of the canyon, away from the scenic views and petroglyphs located within the canyon. There are currently no existing transmission lines in the area. Visual disturbances created by the transmission line itself would permanently alter the recreation setting for scenic driving on portions of the Backway nearest to the 250-foot-wide transmission line ROW; however, the proposed transmission line crossing would be located in an area of considerable oil and gas development (see Section 3.12, Visual Resources, and Appendix I for more information).

Energy Loop: Huntington/Eccles Canyons Scenic Byway. West of Fairview, the 250-foot-wide transmission line ROW would cross the 83-mile Energy Loop: Huntington/Eccles Canyons Scenic Byway (SR-31) several times. The route of the transmission line would largely parallel the Byway in the portion between these crossings. Approximately 17 miles of Byway would fall within the 2-mile transmission line corridor. Less than 1 mile of the Byway would fall within the 250-foot-wide transmission line ROW. There are no existing transmission lines in these areas and the 250-foot-wide transmission line ROW would not be located within any designated utility corridors. The visual disturbances created by the transmission line itself would permanently alter the recreation setting for scenic driving on portions of the Scenic Byway nearest to the 250-foot-wide transmission line ROW. Scenic drivers using the Byway also could be subject to views of road construction within the 2-mile transmission line corridor (see Section 3.12, Visual Resources, and Appendix I for more information). Visual disturbances from construction of new roads would be permanent unless fully restored. During construction, portions of the Byway also could experience additional traffic on segments used for employee commute, supply delivery, etc. (see Section 3.16, Transportation).

Skyline Drive Scenic Backway. The 250-foot-wide transmission line ROW for Alternative II-D would cross the 86-mile Skyline Drive Scenic Backway in the same area where it crosses the Energy Loop: Huntington/Eccles Canyons Scenic Byway. About 4 miles of the Backway would fall within the 2-mile transmission line corridor. Impacts would be similar to those described above. Section 3.12, Visual Resources and **Appendix I** provide additional detail regarding visibility in this area.

Nebo Loop Scenic Byway. Impacts to the Nebo Loop Scenic Byway would be the same as those described under Alternative II-A.

#### Alternative II-E

Alternative II-E would cross dispersed recreation areas in six FOs and three national forests (including several developed recreation sites), one specially managed recreation area, seven WMAs, and would affect small portions of several scenic byways and backways.

# BLM Dispersed Recreation Areas

The route for Alternative II-E largely shares the same corridor as Alternative II-A, with the exception of the middle portion of Region II, where Alternative II-E crosses the Ashley National Forest and Manti La-Sal National Forest. On BLM lands, impacts would be similar to those described under Alternative II-A, except that the Salt Lake FO would have more acreage within the 2-mile transmission line corridor under Alternative II-E, and Alternative II-E would cross a small portion of the Price FO. There are no identified high use areas within these portions of the FOs. Acreages are shown in **Table 3.13-23**.

# BLM SRMAs or Other Specially Managed Recreation Areas

<u>Little Sahara RA</u>. Within the Fillmore FO, impacts to the Little Sahara RA would be the same as those described under Alternative II-A.

## USFS Recreation Areas

Ashley National Forest. Under Alternative II-E, 100 percent of the 250-foot-wide transmission line ROW (300 acres) within the Ashley National Forest would fall within areas classified as roaded natural. These types of areas are managed for recreation in ways that allow for readily evident to moderate evidence of the sights and sounds of human activity. The sights and sounds of construction would be in conformance with area management, though construction would cause temporary adverse impacts to scenic viewers, hikers, campers and other non-motorized users identified in Section 3.13.6. The 2-mile transmission line corridor for Alternative II-E, which represents the maximum area that could be temporarily removed from use during construction due to surface disturbance, increased noise, and human activity, would encompass 15,487 acres within Ashley National Forest. Twelve percent of this acreage (1,822 acres) would be located in areas classified as semi-primitive motorized and 5,802 acres (37 percent) would be within semi-primitive non-motorized areas. This comprises 0.6 percent and 1.6 percent of all semi-primitive motorized and semi-primitive non-motorized areas within the Ashley National Forest, respectively. The sights and sounds of construction and presence of large construction crews and construction traffic would not be consistent with the recreation goals for these areas.

Approximately 100 percent (or 1,822 acres) of the semi-primitive motorized acreage and 99 percent (5,784 acres) of the semi-primitive non-motorized acreage within the 2-mile transmission line corridor would be located within IRAs. Roadless construction methods (see **Appendix D**) would reduce some impacts to semi-primitive motorized and non-motorized areas by eliminating road construction, but could cause a temporary adverse impact to recreationists through additional noise and disturbances. The remaining 18 acres of semi-primitive non-motorized area within the 2-mile transmission line corridor would be located outside IRAs and comprises less than 0.01 percent of all semi-primitive non-motorized acreage within the Ashley National Forest.

As discussed in Section 3.13.6, construction would adversely affect the hunter and wildlife viewer user group through habitat removal, restricted access to areas undergoing construction, and by displacing wildlife in and near construction zones. Construction also would adversely affect the non-mechanized users (hikers, campers, and equestrians) that recreate in this area through construction activity and noise. Recreationists seeking wildlife watching experiences or natural settings would be adversely impacted by construction activities regardless of their timing. Hunters would be adversely impacted only if these activities were scheduled during active hunting seasons. The majority of this route is well within the Hunt Unit 11 and therefore hunters' ability to track displaced game should not be affected. There are no identified high use recreational areas within the 2-mile transmission line corridor in the Ashley National Forest and in general, there are other nearby locations that visitors could temporarily go during construction activities that offer the same recreation opportunities in a similar environment. Operation of the transmission line would affect the visual setting of dispersed recreational opportunities, although in general, the line follows an existing transmission line. Operation and maintenance activities could displace wildlife, affecting hunting or wildlife viewing activities.

<u>Uinta National Forest</u>. Under Alternative II-E, approximately 247 acres of the 250-foot-wide transmission line ROW would fall within areas classified as roaded modified within the Uinta National Forest. The sights and sounds of construction would be in conformance with area management. The 2-mile transmission line corridor for Alternative II-E, which represents the maximum area that could be temporarily removed from use during construction due to surface disturbance, increased noise, and human activity, would encompass 10,349 acres within the Uinta National Forest. Forty-six percent of this acreage (4,752 acres) would be located in areas classified as semi-primitive motorized. This is 1.3 percent of all semi-primitive motorized acreage within the Uinta National Forest. Construction in

these areas would not be in conformance with recreation goals. Impacts to recreation from construction would be similar to those discussed under Alternative II-A. Approximately 3,581 acres of the 4,752 acres within semi-primitive motorized areas within the 2-mile transmission line corridor would be located within IRAs. Roadless construction methods (see **Appendix D**) would reduce some impacts to semi-primitive motorized areas by eliminating road construction, but could cause a temporary adverse impact to recreationists through additional noise and disturbance. The remaining 1,171 acres of semi-primitive motorized area within the 2-mile transmission line corridor would not be located in IRAs and comprises approximately 0.3 percent of the total acreage of all semi-primitive motorized areas within the Uinta National Forest. Impacts to dispersed recreation and high use areas from construction and operation would be similar to those discussed under Alternative II-A, as the route through the Uinta National Forest would be largely the same for both alternatives. The Strawberry IRA and Cedar Knoll IRA micro-siting adjustments would not substantially affect the impact analysis for recreation.

Manti-La Sal National Forest. Under Alternative II-E, approximately 30 acres of the 250-foot-wide transmission line ROW would fall within areas classified as roaded natural within the Manti-La Sal National Forest, and approximately 50 acres would be located in areas classified as semi-primitive motorized. The 2-mile transmission line corridor for Alternative II-E, which represents the maximum area that could be temporarily removed from use during construction due to surface disturbance, increased noise, and human activity, would encompass 4,859 acres within the Manti-La Sal National Forest. Of the total acreage within the 2-mile transmission line corridor, 74 percent (3,592 acres) would be located in areas classified as semi-primitive motorized, which comprises 0.5 percent of all semi-primitive motorized acreage within the Manti-La Sal National Forest. The sights and sounds of construction and presence of large construction crews and construction traffic would not be consistent with the recreation goals for these areas. Approximately 60 percent of the semi-primitive motorized acreage in the 2-mile transmission line corridor (or 2,156 acres) would be located within IRAs. Roadless construction methods (see Appendix D) would reduce some impacts to semi-primitive motorized areas by eliminating road construction, but could cause a temporary adverse impact to recreationists through additional noise and disturbance. The remaining 1,436 acres of semi-primitive motorized area within the 2-mile transmission line corridor would not be located in IRAs and would comprise approximately 0.2 percent of all semi-primitive motorized area within the Manti-La Sal National Forest. Impacts to dispersed recreation and high use areas from construction and operation would be similar to those discussed under Alternative II-A, as the route through the Manti-La Sal National Forest would be largely the same for both alternatives.

#### Other Federal Recreation Areas

Impacts to the Dinosaur National Monument from Alternative II-E would be the same as those described under Alternative II-A.

#### State-managed Recreation Areas

<u>WMAs</u>. Alternative II-E would cross seven WMAs. Impacts to the North Nebo WMA – Spencer Fork Unit, Northwest Manti WMA – Birdseye/Lake Fork Unit, and Northwest Manti WMA – Lasson Draw Unit would be the same as those described under Alternative II-A. Impacts to the South Nebo WMA – Triangle Ranch Unit would be the same as those described under Alternative II-D. Additionally, the 2-mile transmission line corridor would encompass portions of the following WMAs:

- Indian Canyon WMA Cottonwood Canyon Unit: 1,668 acres (22 percent of total WMA acreage);
- Northwest Manti WMA Starvation Unit: 976 acres (16.9 percent of total WMA acreage); and
- Northwest Manti WMA Dairy Fork Unit: 1,600 acres (32.2 percent of total WMA acreage).

The Indian Canyon WMA and Northwest Manti – Dairy Fork Unit are managed for big game. Hunting is a popular activity in the Indian Canyon WMA in winter, though winter vehicular use in the WMA is not encouraged. The Northwest Manti WMA—Starvation Unit is used for big game hunting and fishing and both the Starvation and Dairy Fork units are closed to public access in winter and spring to protect wintering wildlife.

Adherence to timing restrictions during both construction and operation phases would prevent disturbance to wintering big game; however, there still would be some loss of big game habitat through vegetation removal, noise and human activity. Habitat loss would be minimized through application of **REC-2**, which would limit access to existing roads within the WMA and/or require full reclamation of any roads that are constructed. Application of **REC-4** would reduce recreational impacts by rescheduling construction activities within key hunting locales, such as WMAs, to be outside of hunting seasons. During operations, the 250-foot-wide transmission line ROW would still have some level of vegetation maintenance during operations that could affect wildlife habitat, and maintenance-related noise could temporarily affect adjacent hunting, fishing, and wildlife viewing opportunities by making the area less hospitable. Application of **REC-1** (scheduling vegetation maintenance outside of big game hunting seasons where practicable) would further minimize impacts to hunting and wildlife viewing.

CWMUs. The 2-mile transmission line corridor for Alternative II-E also would cross six CWMUs. Impacts to the Crab Creek CWMU would be the same as those described under Alternative II-A. The 2-mile transmission line corridor would encompass approximately 7 percent of the 16,030-acre Minnie Maud Ridge CWMU; 32 percent of the 22,471-acre Emma Park CWMU; 38 percent of the 26,127-acre Soldier Summit CWMU; 18 percent of the 3,853-acre Antelope Creek CWMU; and less than 5 percent of the Scofield Canyons CWMU. Impacts to hunting within the CWMUs in the 2-mile corridor would be similar to those described above. Decisions regarding road construction and timing of construction would be up to the private landowner.

#### Local Recreation Areas

<u>Big Mountain Campground and Bottle Hollow Reservoir</u>. Impacts for Alternative II-E would be the same as those described under Alternative II-A for the Big Mountain Campground and Bottle Hollow Reservoir.

Camp Timberlane. The 250-foot-wide transmission line ROW would encompass 37 acres of the Church of Jesus Christ of Latter Day Saints' Camp Timberlane, while the 2-mile transmission line would encompass 381 acres or 53 percent of the site. Construction noise, activities, and visual disturbances would affect camping at this site during the summer when the camp is available. Groups, families, and individuals that use the camp may be displaced to either other campgrounds in the area or other facilities owned by the church. The camp can hold over 1,000 people and large groups may have difficulty finding a suitable substitute facility nearby. Application of **REC-2** would limit access to existing roads and/or require full reclamation of any new roads. Application of **REC-5** and **REC-6** would reduce impacts to campers by prohibiting construction during weekends and other high use periods and maintaining access to high use areas. However, construction noise and visual impacts would be present during weekdays. In addition, operation of the transmission line would permanently affect the visual setting of recreation opportunities within the camp area and maintenance operations could temporarily affect access to camp facilities and disrupt camp visitors. Section 3.17, Social and Economic Conditions, addresses the economic impacts of construction on this facility.

## Scenic Backways and Byways

Under Alternative II-E, the proposed transmission line would parallel Highway 6 and existing transmission lines between Helper, Utah and Thistle, Utah. In this area, the 250-foot-wide transmission line ROW would cross the entrance to the Huntington/Eccles Canyons Scenic Byway but would be located across the highway from the entrance to the Skyline Drive Scenic Backway and the

Reservation Ridge Scenic Backway. Construction activities could cause temporary adverse effects for scenic drivers; however, byways users would quickly leave the construction area and head away from the Highway 6 corridor. Alternative II-E also would cross the Indian Canyon Scenic Byway (US191) within the Uintah and Ouray Indian Reservation; less than 2 miles of the Byway would be within the 2-mile transmission line corridor. The route would not parallel an existing transmission line in this area. Construction and operation activities would cause adverse impacts to the viewshed of the area. Impacts to the Dinosaur Diamond Prehistoric Byway would be the same as those described above for the Indian Canyon Scenic Byway portion plus those described for the 5-mile section described under Alternative II-A. Impacts to the Nebo Loop Scenic Byway would be the same as those described under Alternative II-A.

# Alternative II-F (Agency Preferred)

Alternative II-F would cross dispersed recreation areas in five FOs and four national forests (including several developed recreation sites), two specially managed recreation areas, and six WMAs. Alternative II-B also would affect portions of several scenic byways.

## BLM Dispersed Recreation Areas

Impacts for Alternative II-F would be the same as those discussed under Alternative II-E for the White River and Richfield FOs. Impacts for Alternative II-F would be similar to those described under Alternative II-B for the Fillmore FO and Alternative II-D for the Vernal FO; slightly more acreage would be included within the 250-foot-wide transmission line ROW and the 2-mile transmission line corridor under Alternative II-F than the other alternatives. Impacts to dispersed recreation within the Salt Lake FO would be similar to those described for Alternative II-E; however, Alternative II-F would include more acreage within the 250-foot-wide transmission line ROW and the 2-mile transmission line corridor. There are no high use areas identified within the analysis area for the Salt Lake FO.

## BLM SRMAs or Other Specially Managed Recreation Areas

<u>Fantasy Canyon and Nine Mile Canyon SRMAs</u>. Impacts for Alternative II-F would be the same as those discussed under Alternative II-D for the Fantasy Canyon and Nine Mile Canyon SRMAs. These are the only two SRMAs impacted by Alternative II-F.

#### USFS Recreation Areas

Impacts for Alternative II-F would be the same as those discussed under Alternative II-E for the Manti-LaSal National Forest and the same as those discussed under Alternative II-B for the Fishlake National Forest. Impacts to the Ashley National Forest would be similar to those discussed under Alternative II-D, though slightly more acreage would be located within areas classified as roaded natural and semi-primitive non-motorized under Alternative II-F. Additional acreage within areas classified as semi-primitive non-motorized also would be located within IRAs. Impacts to the Uinta National Forest would be similar to those discussed under Alternative II-E though slightly more acreage would be included within areas classified as roaded natural and semi-primitive motorized under Alternative II-F. Additional acreage within areas classified as semi-primitive motorized also would be located within IRAs.

## Other Federal Recreation Areas

Impacts to the Dinosaur National Monument from Alternative II-F would be the same as those described under Alternative II-A.

## State-Managed Recreation Areas

<u>WMAs</u>. Impacts for Alternative II-F would be the same as those described under Alternative II-E for the following WMAs, which are the only ones affected by Alternative II-F:

- North Nebo WMA–Spencer Fork Unit (96.4 percent of total WMA acreage);
- Northwest Manti WMA-Birdseye/Lake Fork Unit (71.9 percent of total WMA acreage);
- Northwest Manti WMA–Dairy Fork Unit (32.2 percent of total WMA acreage);
- Northwest Manti WMA–Lasson Draw Unit (0.7 percent of total WMA acreage);
- Northwest Manti WMA–Starvation Unit (16.9 percent of total WMA acreage); and
- South Nebo WMA—Triangle Ranch Unit (72.9 percent of total WMA acreage).

<u>CWMUs</u>. The 2-mile transmission line corridor for Alternative II-F also would cross five CWMUs. Impacts to the Crab Creek and Scofield Canyons CWMUs would be the same as those described under Alternative II-E. The 2-mile transmission line corridor would encompass approximately 4 percent of the 16,030-acre Minnie Maud Ridge CWMU, 12 percent of the 22,471-acre Emma Park CWMU, and 21 percent of the 26,127-acre Solider Summit CWMU. Impacts to hunting within the CWMUs in the 2-mile transmission line corridor would be similar to those described above. Decisions regarding road construction and timing of construction would be up to the private landowner.

## Local Recreation Areas

<u>Big Mountain Campground and Camp Timberlane</u>. Impacts for Alternative II-F would be the same as those described under Alternative II-A for the Big Mountain Campground and Alternative II-E for Camp Timberlane, though slightly less acreage would be within the 250-foot-wide transmission line ROW and the 2-mile transmission line corridor under Alternative II-F for Camp Timberlane.

## Scenic Backways and Byways

Impacts for Alternative II-F would be the same as those described under Alternative II-E for the Indian Canyon Scenic Byway, Nebo Loop Scenic Byway, and Skyline Drive Scenic Backway. Impacts for Alternative II-F also would be the same as those described under Alternative II-A for the Dinosaur Diamond Prehistoric Byway and the same as those described under Alternative II-D for the Nine Mile Canyon Scenic Backway.

Reservation Ridge Scenic Backway. The 2-mile transmission line corridor for Alternative II-F would encompass 13 miles or approximately 29 percent of the Reservation Ridge Scenic Backway west of Highway 191. Less than 2 miles of the 250-foot-wide transmission line ROW would include this Backway. During construction, scenic drivers using the Backway would be subject to views of transmission line and access road construction. Wire installation across the road would cause temporary delays in traffic. The visual disturbances created by the transmission line itself would permanently alter the recreation setting for scenic driving on portions of the Backway. Section 3.12, Visual Resources, and **Appendix I** provide additional detail regarding visibility along the Backway.

## **Alternative Variations**

Emma Park Alternative Variation

**Table 3.13-28** summarizes impacts associated with the use of the Emma Park Alternative Variation in Region II.

Table 3.13-28 Summary of Region II Alternative Variation Impacts to Recreation

Alternative Variation	Analysis
Emma Park Alternative Variation	Under this variation, the 2-mile transmission line corridor would affect 1,874 acres of undesignated BLM lands within the Price FO; 2,789 acres within the Salt Lake FO; and 503 acres within the Vernal FO. This is 0.1 percent or less of BLM-managed lands within each FO available for dispersed recreation. The 2-mile transmission line corridor would encompass 3 acres of the Nine Mile Canyon SRMA within the BLM Vernal FO area, approximately 0.01 percent of the SRMA area. The 2-mile transmission line corridor also would affect 2 acres within the Uinta National Forest; 62 percent of the 16,030-acre Minnie Maud Ridge CWMU; 37 percent of the 22,471-acre Emma Park CWMU; and 14 percent of the 26,127-acre Soldier Summit
	CWMU. Less than 1 mile of the Dinosaur Diamond Prehistoric Byway and Indian Canyon Scenic Byway (along the same route) would be encompassed by the 2-mile transmission line corridor and the variation would cross the byways once at Highway 191.

# Alternative Connectors in Region II

**Table 3.13-29** summarizes the impacts associated with the alternative connectors in Region II. Although the Highway 191 connector would not affect any BLM or NFS lands, it would affect two scenic byways and one CWMU. The IPP East connector would impact the fewest acres of BLM lands.

Table 3.13-29 Summary of Region II Alternative Connector Impacts to Recreation

Alternative Connector	Analysis	
Lynndyl Alternative Connector	Affects recreation on 11,107 acres of undesignated BLM lands within the Fillmore FO. This is 0.3 percent of BLM-managed lands within the FO available for dispersed recreation. No SRMAs are located within this connector. Also would affect 1,101 acres within the Fishlake National Forest, mostly within the Semi-primitive Motorized ROS class (0.01 percent of total acres within this class). Would affect several very short out-and-back OHV routes in the Fishlake National Forest.	
IPP East Alternative Connector	Affects recreation on 1,843 acres of undesignated BLM lands within the Fillmore FO. This is 0.04 percent of BLM-managed lands within the FO available for dispersed recreation. No special recreation management areas are located within this connector.	
Castle Dale Alternative Connector	Affects recreation on 2,456 acres of undesignated BLM lands within the Price FO. This is 0.2 percent of BLM-managed lands within the FO available for dispersed recreation. No special recreation management areas are located within this connector. Also would affect less than 2 miles of the Wedge Overlook/Buckhorn Drive Scenic Backway.	
Price Alternative Connector	Affects recreation on 6,399 acres of undesignated BLM lands within the Price FO. This is 0.5 percent of BLM-managed lands within the FO available for dispersed recreation. No SRMAs are located within this connector. Would affect 659 acres of the 15,355-acre Hiawatha CWMU and 3,017 acres within the Gordon Creek WMA.	
Highway 191 Alternative Connector	Affects 3 miles of the Dinosaur Diamond Prehistoric Byway and Indian Canyon Scenic Byway and 77 acres of the Emma Park CWMU. The connector would cross the byways once (are on the same route).	

# Region II Conclusion

In Region II, Alternative II-A (Applicant Proposed) would affect the fewest BLM recreation areas and least amount of dispersed recreation area acreage. Alternative II-A also would affect the fewest miles of scenic byways/backways and the least amount of acreage within CWMUs, but would affect the most WMAs and a state park. All alternatives would affect some developed recreation sites within at least one national forest; Alternative II-D affects the least amount of acreage within national forests. Alternative II-C affects the least amount of acreage within WMAs.

# 3.13.6.11 Region III

**Table 3.13-30** provides a summary of Region III recreation areas/sites by alternative, both within the 250-foot-wide transmission line ROW and 2-mile transmission corridor.

Table 3.13-30 Region III Recreation Areas within the 250-foot-wide Transmission Line ROW and 2-mile Transmission Line Corridor

	Alternative III-A	Alternative III-B	Alternative III-C
	250-foot-wide ROW 2-mile Corridor	250-foot-wide ROW 2-mile Corridor	250-foot-wide ROW 2-mile Corridor

<sup>\*</sup> Nellis Dunes SRMA is located in both Region III and Region IV. Within Region IV, there are 183 acres of this SRMA within the 2-mile transmission line corridor under all alternatives. See Region IV analysis for more information.

# Alternative III-A (Applicant Proposed)

Under Alternative III-A, the 250-foot-wide transmission line ROW and the 2-mile transmission line corridor would cross dispersed recreation areas within five FOs, one national forest, and one SRMA. A portion of the 2-mile transmission line corridor also would cross one privately managed public recreation area. Areas affected by Alternative III-A include a popular ATV area, a nationwide hiking trail, and one backcountry byway.

# BLM Dispersed Recreation Areas

General construction impacts to dispersed recreation activities are described in Section 3.13.6 and include displacing visitors due to area closures, noise, or visual presence of construction, or making the area inhospitable for wildlife. Within Region III, the 250-foot-wide transmission line ROW for Alternative III-A would impact 2,126 acres of dispersed recreation area in the Fillmore FO; 1,256 acres in the Cedar City FO; 747 acres in the St. George FO; 651 acres in the Caliente FO; and 1,518 acres in the Las Vegas FO.

The 2-mile transmission line corridor for Alternative III-A, which represents the maximum area that could be temporarily removed from use during construction due to surface disturbance, increased noise, and human activity, would encompass the following acreages of dispersed recreation area within each FO:

- Fillmore FO: 96,673 acres (2.2 percent of total available acreage for dispersed recreation within the FO).
- Cedar City FO: 57,249 (2.7 percent of total available acreage for dispersed recreation within the FO).
- St. George FO: 32,409 (6.4 percent of total available acreage for dispersed recreation within the FO).
- Caliente FO: 25,917 (0.7 percent of total available acreage for dispersed recreation within the FO).
- Las Vegas FO: 57,488 (3.1 percent of total available acreage for dispersed recreation within the FO).

As discussed in Section 3.13.6, construction impacts would have temporary adverse impacts to the hunters and wildlife viewer user groups and to non-mechanized users such as hikers or backpackers due to the direct loss of habitat from vegetation removal within the 250-foot-wide transmission line ROW and aesthetic impacts within the 2-mile transmission line corridor that would make recreation experiences in those areas undesirable or cause wildlife to leave the area. Construction would affect recreation use particularly on Saturdays (there will be no construction on Sundays), during the spring and fall when general recreation use peaks in this area, during hunting seasons, and during competitive OHV events. However, the areas affected comprise a small percentage of the FO areas and there are public lands adjacent to affected areas that can accommodate these recreation activities; except for competitive OHV events.

Within the Fillmore FO, the 250-foot-wide transmission line ROW would cross three of the four Cricket Mountain ATV trail system access roads, as well as several of the trails within the trail system. Within the Cedar City FO, Alternative III-A also would cross the American Discovery Trail (ADT) just west of Milford. The 250-foot-wide transmission line ROW would largely be within a designated utility corridor and would parallel an existing transmission line in these areas. Restricted access to the Cricket Mountain ATV trail system or the ADT during construction would be an adverse impact for recreational users of these trails. Per the PDTR (see **Appendix D**), guard structures or other safety measures would be used in areas where power lines cross railroads, roads or other public access ways during wire installation; fencing also may be used to restrict public access to work areas. Application of **REC-6** would reduce impacts to recreational users by allowing users continued access to all or part of the Cricket Mountain ATV trail system and the ADT; however, the noise and visual impacts from construction activities would still constitute an adverse effect to the recreational experience of those using the ADT. It is assumed that these construction activities would not substantively affect motorized drivers in the Cricket Mountain ATV trail system due to the noise of the motorized vehicles used on the trail system.

Alternative III-A would cross popular OHV routes near and within the Beaver Dam Wash NCA and would affect two trailheads (BLM 2011g). However, other trailheads would be available and most of the NCA would not be affected, likewise for the Beaver Dam Slope and Mormon Mesa ACECs (see Section 3.15, Special Designation Areas). Alternative III-A also would cross the Old Spanish Trail once east of Moapa and cross and parallel the trail near Highway 18 in Dixie National Forest, in addition to crossing the trail at the end of Region III (see Section 3.11, Cultural Resources and Native American Concerns, and Section 3.15, Special Designation Areas).

Within the Las Vegas FO, Alternative III-A would cross lands used for competitive OHV events on BLM land east of Nellis Dunes and southwest of the Muddy Mountains SRMA. It is assumed that impacts from noise or visual disturbances would not substantively affect recreational use of these areas or motorized drivers; however, restricted access to these areas during competitive events would be an adverse impact for recreational users in this area. The following mitigation is recommended to reduce impacts to specially permitted events:

**REC-9**: The applicant shall plan construction activities to occur outside of specially permitted event areas or times; or work with organizers to ensure adequate access and use if feasible given notice of permit timing.

Application of this measure would successfully reduce conflicts with special events and also could result in some benefits to both parties (shared bathroom facilities, parking areas, etc.).

#### BLM SRMAs or Other Specially Managed Recreation Areas

Muddy Mountains SRMA. Within the Las Vegas FO, approximately 2 miles of Alternative III-A would cross the Muddy Mountains SRMA. Approximately 72 acres of the 250-foot-wide transmission line ROW and 4,202 acres of the 2-mile transmission line corridor would fall within the 123,400-acre Muddy Mountains SRMA. These acreages comprise 0.1 percent and 3.4 percent of the SRMA, respectively. This SRMA is managed to provide integrated management of wildlife habitat, cultural resources, and other recreational uses and contains both semi-primitive motorized and non-motorized (wilderness) areas. Placement of the 250-foot-wide transmission line ROW would be within the designated utility corridor and therefore consistent with recreational management goals; however, portions of the 2-mile transmission line corridor, which would contain roads and other construction facilities, would extend slightly beyond the designated utility corridor. Construction and operation of the transmission line would remove wildlife habitat and permanently alter the semi-primitive recreational setting within nearby portions of the SRMA, adversely impacting those user groups seeking a naturalappearing environment with little evidence of disturbance. Additionally, during peak construction, construction activity and noise would affect recreationists within the entire 2-mile transmission line corridor, extending the area affected to about 3.4 percent of the SRMA. Application of REC-2 would minimize impacts by limiting access to existing roads within the SRMA and/or requiring full reclamation of any roads that are constructed. This would reduce habitat modification and fragmentation; however, 72 acres of habitat (0.1 percent of the SRMA) would still have some level of vegetation maintenance during operations that could affect hunting and wildlife viewing and result in visual impacts despite mitigation.

## USFS Recreation Areas

<u>Dixie National Forest</u>. Under Alternative III-A, approximately 184 acres of the 250-foot-wide transmission line ROW would fall within areas classified as roaded natural within the Dixie National Forest. These types of areas are managed for recreation in ways that allow for readily evident to moderate evidence of the sights and sounds of human activity. The sights and sounds of construction would be in conformance with area management, though construction would cause temporary adverse impacts to scenic viewers, hikers, campers and other non-motorized users identified in Section 3.13.6. Areas classified as semi-primitive motorized, while having some evidence of other users and motorized use, have a low concentration of users, and a predominantly natural or natural-appearing environment. Approximately 9,076 acres within the 2-mile transmission line corridor would be located in areas classified as semi-primitive motorized. This is 38 percent of the total acreage of the 2-mile transmission line corridor within the Dixie National Forest (23,803 acres) and 7.8 percent of all semi-primitive motorized acreage within the Dixie National Forest. The total acreage within the 2-mile transmission line corridor represents the maximum area that could be temporarily removed from use during construction due to surface disturbance, increased noise, and human activity. Approximately 10,331 acres (43 percent) within the 2-mile transmission line corridor would be within areas classified as semi-primitive non-motorized. The sights and sounds of construction and presence of large construction crews and construction traffic would not be consistent with the recreation goals for this area, which comprises 4.6 percent of all semi-primitive non-motorized acreage within the Dixie National Forest. Over 42 percent of semi-primitive motorized areas (or 3,826 acres) and 94 percent (9,717 acres) of the semi-primitive non-motorized areas within the 2-mile transmission line corridor would be located within IRAs. Construction within IRAs would use roadless construction methods identified in Appendix D. This would reduce some impacts to semi-primitive motorized and non-motorized areas by eliminating road construction; however, helicopter construction and/or

overland travel itself also likely would be a temporary adverse impact to recreationists in these areas. The remaining 5,250 acres of semi-primitive motorized area within the 2-mile transmission line corridor would not be within IRAs and comprises approximately 4.5 percent of all semi-primitive motorized area within the Dixie National Forest. The remaining 614 acres of semi-primitive non-motorized area within the 2-mile transmission line corridor would comprise approximately 0.3 percent of all semi-primitive non-motorized area within the Dixie National Forest. Impacts to IRAs are discussed in more detail in Section 3.15, Special Designation Areas.

As discussed in Section 3.13.6, construction would adversely affect the hunters and wildlife viewer user group through habitat removal, restricted access to areas undergoing construction, and by displacing wildlife in and near construction zones. Construction would adversely affect the non-mechanized user group (hikers, campers, and equestrians) that recreate in this area due to construction activity and noise. During construction, wildlife may be displaced to areas that are not within the unit for which hunters are licensed. Hunters would be adversely impacted only if these activities were scheduled during active hunting seasons; recreationists seeking wildlife watching experiences or natural settings would be adversely impacted by construction activities regardless of their timing. Impacts would be greatest during summer and during hunting seasons. Application of REC-1, and REC-2 would assist in reducing impacts to hunters and wildlife watchers, as well as reduce scenic impacts from access road construction.

High use areas within the Dixie National Forest include the area along Highway 18 near the Mountain Meadows Massacre site. Construction activities for Alternative III-A would adversely impact scenic driving along this segment of Highway 18 and visitors at this historic site would experience construction noise and visual disturbances. These impacts plus vegetation removal within the 250-foot-wide transmission line ROW would not meet the partial retention visual objectives for this area without mitigation (see Section 3.12, Visual Resources and Appendix I for a discussion of impacts and suggested mitigation). Application of REC-5 would minimize impacts to recreational drivers and visitors to these sites by prohibiting construction during weekends and other high use periods in areas that are adjacent to developed recreation sites. Operation of the transmission line would have less adverse impacts to recreation users because the line would be located parallel to an existing transmission line and because the 250-foot-wide transmission line ROW would be reclaimed (see mitigation measures identified in Section 3.12, Visual Resources). Outside of this area, the area affected in the Dixie National Forest comprises a small percentage of the Dixie National Forest and there are public lands directly adjacent to affected areas that would be able accommodate the same recreation activities. Project roads could result in unauthorized OHV use (and associated resource damage, noise, etc.) as well as permanent visual impacts within dispersed recreation areas. Please see Section 3.13.6.8 regarding potential impacts from Project access roads.

# State-managed Recreation Areas

There are no state-managed recreation areas within Alternative III-A.

#### Local Recreation Areas

Newcastle Reservoir. The 250-foot-wide transmission line ROW would cross E. Pinto Canyon Road, which is used to access Newcastle Reservoir, a popular area for fishing. TWE's guard structures and other safety measures would allow continued use of this road and access to this recreational area, although there could be some delays in traffic during peak construction times. Operation of the line is not expected to substantively affect recreational use of the reservoir because the 250-foot-wide transmission line ROW would parallel an existing transmission line in this area, resulting in minimal visual impacts to recreation users. Additionally, BMPs and other stipulations would be utilized to reduce erosion and resulting sedimentation that could affect water quality (and therefore fishing success) within the reservoir. A monument to the Jefferson Hunt party of 1849, located on Bench Road, would be within the 2-mile transmission line corridor.

# Scenic Backways and Byways

Bitter Springs Backcountry Byway. The 250-foot-wide transmission line ROW for Alternative III-A would cross the Bitter Springs Backcountry Byway in the Muddy Mountains SRMA. Approximately 2 miles of the Byway would be within the 2-mile transmission line corridor. There are currently no existing transmission lines in the area; however, the transmission line would be located within a designated utility corridor. Visual disturbances created by the transmission line itself would permanently alter the recreation setting for scenic driving for a portion of the Byway nearest to the 250-foot-wide transmission line ROW. In addition, scenic drivers using the Byway also would be subject to views of construction within the 2-mile transmission line corridor. Section 3.12, Visual Resources, and **Appendix I** provide additional detail regarding visibility in this area.

# Alternative III-B (Agency Preferred)

Under Alternative III-B, the 250-foot-wide transmission line ROW and 2-mile transmission line corridor would cross dispersed recreation areas within four BLM FOs, but would not cross any SRMAs. One backcountry byway also would be affected by Alternative III-B.

## BLM Dispersed Recreation Areas

Within Region III, the 250-foot-wide transmission line ROW for Alternative III-B would impact 2,096 acres of dispersed recreation area in the Fillmore FO, 1,122 acres within the Cedar City FO, 2,032 acres within the Caliente FO, and 1,123 acres within the Las Vegas FO. Alternative III-B would not enter the St. George FO or the Dixie National Forest.

The 2-mile transmission line corridor for Alternative III-B, which represents the maximum area that could be temporarily removed from recreation use during construction due to surface disturbance, increased noise, and human activity, would encompass the following acreages of dispersed recreation area within each FO:

- Fillmore FO: 101,464 acres (2.3 percent of total available acreage for dispersed recreation within the FO).
- Cedar City FO: 53,732 acres (2.6 percent of total available acreage for dispersed recreation within the FO).
- Caliente FO: 81,729 acres (2.3 percent of total available acreage for dispersed recreation within the FO).
- Las Vegas FO: 38,488 acres (2.1 percent of total available acreage for dispersed recreation within the FO).

Impacts to dispersed recreation in the Fillmore, Cedar City, and Las Vegas FOs would be the similar to those described under Alternative III-A.

Within the Caliente FO, Alternative III-B would pass through dispersed recreation areas currently containing no existing utility lines, although the route would be partially within an existing designated corridor. Construction and operation of the transmission line would be an adverse impact to those seeking primitive recreation experiences in these portions of the FO, which includes the Clover Mountain Wilderness Area (see Section 3.15, Special Designation Areas).

#### BLM SRMAs or Other Specially Managed Recreation Areas

There are no SRMAs within the 2-mile transmission line corridor for Alternative III-B.

# USFS Recreation Areas

There are no NFS lands within the 2-mile transmission line corridor in Alternative III-B.

## State-managed Recreation Areas

Zane CWMU. The 250-foot-wide transmission line ROW for Alternative III-B would encompass about 195 acres (2 percent) of the 9,779-acre Zane CWMU. Impacts to hunting in these areas would be the same as discussed for WMAs and CWMUs within Region II. Impacts to hunting within the 2-mile transmission line corridor area would be similar to those described in Region II and would encompass over 50 percent of the CWMU. Decisions regarding road construction and timing of construction would be up to the private landowner.

#### Local Recreation Areas

There are no local recreation areas within Alternative III-B.

# Scenic Backways and Byways

Rainbow Canyon Backcountry Byway. The 250-foot-wide transmission line ROW for Alternative III-B would cross the Rainbow Canyon Backcountry Byway twice, once on the eastern portion of the loop and once on the southern portion of the loop. Approximately 5 miles of the Byway would be within the 2-mile transmission line corridor. There currently are no existing transmission lines in the area; however, the transmission line would be located within a designated utility corridor at the farthest west Byway crossing. Visual disturbances created by the transmission line itself would permanently alter the recreation setting for scenic driving for a portion of the Byway nearest to the 250-foot-wide transmission line ROW. In addition, scenic drivers using the Byway also would be subject to views of construction within the 2-mile transmission line corridor. Wire installation across the road would cause temporary delays in traffic. Section 3.12, Visual Resources, and **Appendix I** provide additional detail regarding visibility in this area.

## Alternative III-C

Under Alternative III-C, the 250-foot-wide transmission line ROW and the 2-mile transmission line corridor would cross dispersed recreation areas within four FOs and one SRMA. Portions of the 2-mile transmission line corridor also would cross two additional SRMAs. Alternative III-C also would affect one scenic byway and one backcountry byway.

## BLM Dispersed Recreation Areas

Within Region III, the 250-foot-wide transmission line ROW for Alternative III-C would impact 2,091 acres of dispersed recreation area in the Fillmore FO; 1,122 acres within the Cedar City FO; 2,739 acres within the Caliente FO; and 1,237 acres within the Las Vegas FO. Alternative III-C would not enter the St. George FO or the Dixie National Forest.

The 2-mile transmission line corridor for Alternative III-C, which represents the maximum area that could be temporarily removed from recreation use during construction due to surface disturbance, increased noise, and human activity, would encompass the following acreages of dispersed recreation area within each FO:

- Fillmore FO: 101,450 acres (2.3 percent of total available acreage for dispersed recreation within the FO).
- Cedar City FO: 53,616 acres (2.5 percent of total available acreage for dispersed recreation within the FO).
- Caliente FO: 114,595 acres (3.2 percent of total available acreage for dispersed recreation within the FO).
- Las Vegas FO: 44,147 acres (2.4 percent of total available acreage for dispersed recreation within the FO).

Impacts to dispersed recreation in the Fillmore, Cedar City, and Las Vegas FOs would be the same as those described under Alternative III-A.

Alternative III-C would pass through dispersed recreation areas within the Caliente FO near Caliente and south along Highway 93 and the Delamar Mountains wilderness area. Much of the affected area contains an existing transmission line. Construction and operation of the transmission line would have an adverse impact to those seeking primitive recreation experiences in these portions of the FO; especially near the Delamar Mountains wilderness area (see Section 3.15, Special Designation Areas).

## BLM SRMAs or Other Specially Managed Recreation Areas

Chief Mountain SRMA. Within the Caliente FO, approximately 16 miles of Alternative III-C would cross the 111,181-acre Chief Mountain SRMA. The SRMA is managed for a variety of recreation opportunities, including rock hounding, trilobite collecting, camping, hunting, and both event-organized and casual OHV riding. The SRMA contains 413 miles of roads, OHV routes, and trails, including 39 miles of the Silver State Trail. During construction, approximately 488 acres (0.2 percent of the SRMA) would be subject to vegetation removal and other surface disturbing activities associated with transmission line construction within the 250-foot-wide transmission line ROW. The 250-foot-wide transmission line ROW would not be located within a designated utility corridor within the SRMA, nor collocated with existing transmission lines and would cross several existing OHV trails, including a portion of the Silver State Trail. Restricted access to the trail system or the Silver State Trail during construction would be an adverse impact to recreational use of the trails and to motorized drivers in this area. Other access points in the SRMA and to the Silver State Trail would remain unaffected by construction (BLM 2011h). Application of REC-6 would reduce impacts to recreational use of the trails and to motorized drivers in this area by allowing users continued access to all or part of the trail system. Section 3.12, Visual Resources, and Appendix I provide additional detail regarding visibility along the Silver State Trail, trailhead, and parking area.

A total of 18,618 acres (16.7 percent of the SRMA) would be located within the 2-mile transmission line corridor. This area would include road construction and represents the maximum area that could be temporarily removed from recreation use during construction due to surface disturbance, increased noise, and human activity. It is assumed that aesthetic impacts from construction or operation of the transmission line would not substantively affect recreational use of the OHV trails or motorized drivers, due to the noise of the motorized vehicles used on the trail system; however, other user groups such as rock hounders or trilobite collectors would be adversely affected by the noise and activity. The Oak Springs trilobite site would be less than one mile from the corridor; recreationists using the picnic facilities in this area would be temporarily adversely affected by the sights and sounds of construction. Development of additional access roads within the 2-mile transmission line corridor would be an adverse impact if they restricted access to the recreational roads and trails already present in the area and also could lead to unauthorized OHV use in the area if not fully reclaimed. Application of REC-2 would reduce the impact from road construction by limiting access within the SRMA to existing roads or requiring closure or reclamation in consultation with the BLM; however, it also is important to note that use of existing roads would be an adverse impact to recreation if construction use of the roads conflicted with recreational use of the area.

North Delamar SRMA. Less than 1 acre of the 2-mile transmission line corridor, in which roads and construction support areas could be constructed, would be located within the North Delamar SRMA. The corridor would cross near the western border of the SRMA where the route follows a designated utility corridor and existing transmission line. Application of **REC-2** and **REC-3** would eliminate impacts to this area by limiting any access within the SRMA to existing roads or requiring any new roads to be located within the exiting corridor.

Nellis Dunes SRMA. Within the Las Vegas FO, approximately 142 acres of the 2-mile transmission line corridor would be located within the Nellis Dunes SRMA. As an area of intensive OHV use, construction and operation of a transmission line is not expected to impact recreational use in this area unless access for recreation or recreational events was restricted. Application of **REC-6** and **REC-9** would reduce impacts to recreation by keeping trails open or directing users to comparable trails and scheduling construction outside of specially permitted events.

Impacts to NWRs are discussed in Section 3.15, Special Designations.

USFS Recreation Areas

There are no NFS lands within the 2-mile transmission line corridor for Alternative III-C.

State-managed Recreation Areas

Impacts to CWMUs would be the same as those described under Alternative III-B.

Local Recreation Areas

There are no local recreation areas within Alternative III-C.

Scenic Backways and Byways

Rainbow Canyon Backcountry Byway. The 250-foot-wide transmission line ROW for Alternative III-C would cross the Rainbow Canyon Backcountry Byway once near Caliente, Nevada. Approximately 5 miles of the Byway would be within the 2-mile transmission line corridor. There currently are no existing transmission lines in the area. Visual disturbances created by the transmission line itself would permanently alter the recreation setting for scenic driving for a portion of the Byway nearest to the 250-foot-wide transmission line ROW. In addition, scenic drivers using the Byway also would be subject to views of construction within the 2-mile transmission line corridor. Wire installation across the road would cause temporary delays in traffic. Section 3.12, Visual Resources, and **Appendix I** provide additional detail regarding visibility in this area.

Highway 93 Scenic Byway. The 250-foot-wide transmission line ROW would cross the Highway 93 Scenic Byway twice west of Caliente, Nevada, within the Chief Mountain SRMA. Approximately 15 miles of the Byway would be within the 2-mile transmission line corridor. There currently are no existing transmission lines in the area. Visual disturbances created by the transmission line itself would permanently alter the recreation setting for scenic driving for a portion of the Byway nearest to the 250-foot-wide transmission line ROW. In addition, scenic drivers using the Byway also would be subject to views of construction within the 2-mile transmission line corridor. Wire installation across the road would cause temporary delays in traffic. Section 3.12, Visual Resources, and **Appendix I** provide additional detail regarding visibility in this area.

West of Caliente, the 250-foot-wide transmission line ROW would cross the Silver State Backcountry Byway within the Chief Mountain SRMA. Impacts to this Byway (the Silver State Trail) are included in Chief Mountain SRMA analysis.

## Alternative Variations in Region III

**Table 3.13-31** provides a comparison of impacts associated with the alternative variations in Region III.

Table 3.13-31 Summary of Region III Alternative Variation Impacts to Recreation

Alternative Variation	Analysis
Ox Valley East Alternative Variation (Alternative III-A)	250-foot-wide transmission line ROW would cross 205 acres of NFS lands; 2-mile transmission line corridor would cross 6,526 acres of NFS lands. Avoids Alternative III-A impacts to scenic driving and viewing the Mountain Meadows Massacre site along Highway 18 in Dixie National Forest and would reduce crossings of the Old Spanish Trail; however, this variation would cross several trails within the Ox Valley ATV Trail system and would largely parallel route FS 007. Restricted access to the trail system would be an adverse impact to motorized drivers in this area and would affect use of the trail; application of <b>REC-6</b> would reduce this impact.
Ox Valley West Alternative Variation (Alternative III-A)	250-foot-wide transmission line ROW would cross 15 acres of BLM lands, 196 acres of NFS lands; 2-mile transmission line corridor would cross 29 acres of BLM lands and 2,233 acres of NFS lands. Avoids Alternative III-A impacts to scenic driving and viewing the Mountain Meadows Massacre site along Highway 18 in Dixie National Forest and would reduce crossings of the Old Spanish Trail; however, this variation would cross several trails within the Ox Valley ATV Trail system and would largely parallel route FS 007. Restricted access to the trail system would be an adverse impact to motorized drivers in this area and would affect use of the trail; application of <b>REC-6</b> would reduce this impact.
Pinto Variation (Alternative III-A)	250-foot-wide transmission line ROW would cross 628 acres of NFS lands and 205 acres of BLM land; 2-mile transmission line corridor would cross 25,296 acres of NFS lands and 5,506 acres of BLM land. Avoids impacts to scenic driving and viewing the Mountain Meadows Massacre site along Highway 18 in Dixie National Forest and would reduce crossings of the Old Spanish Trail. Avoids crossing the access road to Newcastle Reservoir, but 2-mile transmission line corridor would encompass 111 acres near the southern and western portions of the reservoir. The route would cross FR 009 and/or parallel FR 011 along Pinto Creek, with permanent adverse impacts to the scenic viewshed of visitors driving recreationally on this route, recreating near the community of Pinto or those that have vacation or second homes in the area. The Pinto Variation also would impact fishing use of and anglers at the Baker Dam (BLM) and Santa Clara River (USFS) Fishing Access recreation sites. Application of REC-5 would minimize impacts to the community of Pinto and anglers at the two fishing access sites by prohibiting construction during weekends and other high use periods.

# Alternative Connectors in Region III

**Table 3.13-32** provides a comparison of impacts associated with alternative connectors in Region III. Both connectors would affect recreation on undesignated BLM lands, primarily OHV use.

Table 3.13-32 Summary of Region III Alternative Connector Impacts to Recreation

Alternative Connector	Analysis	
Avon Alternative Connector	Affects recreation on 4,383 acres of undesignated BLM lands within the Cedar City FO. This is	
	0.2 percent of BLM-managed lands within the FO available for dispersed recreation. No special	
	recreation management areas are located within this connector.	
Moapa Alternative	Affects recreation on 11,538 acres of undesignated BLM lands within the Las Vegas FO. This is	
Connector	0.6 percent of BLM-managed lands within the FO available for dispersed recreation. No special	
	recreation management areas are located within this connector.	

# Alternative Ground Electrode Systems in Region III

All seven alternative configurations for the ground electrode system would affect undesignated BLM lands adjacent to the Mormon Mesa ACEC. The Meadow Valley II alternative would have the greatest

impact on dispersed recreation opportunities such as hunting, camping and OHV use because of the distance from the corridor compared to the other alternatives that have shorter transmission line lengths and smaller site footprints. The Mormon Mesa-Carp Elgin Road, Halfway Wash-Virgin River, and Halfway Wash East alternatives would impact dispersed recreation uses, including very popular OHV trails, and would reduce OHV trail mileage available for use by the public during construction and operation. **Table 3.13-33** provides a comparison of impacts to recreation for each alternative electrode facility location proposed near the southern terminal. Some locations might serve multiple alternative routes, while others could only be associated with a certain alternative route.

Table 3.13-33 Summary of Region III Alternative Ground Electrode System Location Impacts to Recreation

Alternative Ground Electrode System Location	Analysis	
Mormon Mesa-Carp Elgin Road (Alternative III-A)	91 acres of disturbance from construction, 19 acres from operations. Affects undesignated BLM lands adjacent to the Las Vegas FO Mormon Mesa ACEC, including very popular OHV trails.	
Mormon Mesa-Carp Elgin Road (Alternative III-B)	103 acres of disturbance from construction, 26 acres from operations. Affects undesignated BLM lands adjacent to the Las Vegas FO Mormon Mesa ACEC, including very popular OHV trails.	
Halfway Wash-Virgin River (Alternative III-A)	84 acres of disturbance from construction, 16 acres from operations. Affects undesignated BLM lands adjacent to the Las Vegas FO Mormon Mesa ACEC, including very popular OHV trails.	
Halfway Wash-Virgin River (Alternative III-B)	93 acres of disturbance from construction, 20 acres from operations. Affects undesignated BLM lands adjacent to the Las Vegas FO Mormon Mesa ACEC, including very popular OHV trails.	
Halfway Wash East (Alternative III-A)	104 acres of disturbance from construction, 26 acres from operations. Affects undesignated BLM lands adjacent to the Las Vegas FO Mormon Mesa ACEC, including very popular OHV trails.	
Halfway Wash East (Alternative III-B)	102 acres of disturbance from construction, 25 acres from operations. Affects undesignated BLM lands adjacent to the Las Vegas FO Mormon Mesa ACEC, including very popular OHV trails.	
Meadow Valley 2 (Alternative III-C)	174 acres of disturbance from construction, 66 acres from operations. Affects undesignated BLM lands adjacent to the Mormon Mesa ACEC as well as <1 acre within the ACEC. Impacts OHV use. This alternative affects more dispersed recreation than the other alternatives due to the longer transmission line length.	

## Region III Conclusion

Within Region III, Alternative III-C would affect the most recreation areas and scenic byways/ backways. Alternative III-B (Agency Preferred) would affect the fewest recreation areas. However, Alternative III-B could affect competitive events near Nellis Dunes SRMA and access to the Cricket Mountains ATV trail system and ADT; implementation of mitigation measures **REC-6** through **REC-9** would reduce impacts by maintaining access to trails and scheduling construction around specially permitted event areas or times. Therefore, with implementation of mitigation measures **REC-6** through **REC-9**, this alternative would have the least impact on recreation use, activities, and settings. In comparison, Alternative III-A (Applicant Proposed) would affect additional recreation areas, including Dixie National Forest, and would affect recreation within a popular OHV area in the St. George FO.

#### 3.13.6.12 Region IV

**Table 3.13-34** provides a summary of Region IV recreation areas/sites by alternative, both within the 250-foot-wide transmission line ROW and the 2-mile transmission line corridor.

TransWest Express EIS Section 3.13 – Recreation Resources 3.13-93

Table 3.13-34 Region IV Recreation Areas within the 250-foot-wide Transmission Line ROW and 2-mile Transmission Line Corridor

Recreation Area/Site	Alternative IV-A 250-foot-wide ROW 2-mile Corridor Acres (% of Total Area)	Alternative IV-B 250-foot-wide ROW 2-mile Corridor Acres (% of Total Area)	Alternative IV-C 250-foot-wide ROW 2-mile Corridor Acres (% of Total Area)
BLM Las Vegas FO			
Dispersed, undesignated recreation areas	213 (0.01) 6,990 (0.4)	190 (0.01) 6,765 (0.4)	190 (0.01) 6,765 (0.4)
Nellis Dunes SRMA	0 183 (1.2)	0 183 (1.2)	0 183 (1.2)
Sunrise Mountain SRMA	330 (0.9) 11,155 (29.7)	43 (0.1) 1,825 (4.9)	43 (0.1) 1,825 (4.9)
Las Vegas Valley SRMA	296 (0.2) 8,209 (4.2)	12 (<0.01) 535 (0.3)	N/A
Nelson/Eldorado SRMA	151 (0.2) 7,871 (8.6)	107 (0.1) 3,498 (3.8)	0 29 (<0.1)
Other Federally Managed Recreation	n Areas		
Sloan Canyon NCA	0 2,684 (6)	N/A	N/A
Lake Mead NRA (NPS)	0 25 (<0.01)	427 (0.03) 12,871 (<1)	414 (0.03) 14,482 (<1)
Local Recreation Areas			
Clark County Wetlands Park	18 (0.6) 376 (13)	N/A	N/A
Cascata Golf Course	N/A	0 229 (53)	N/A
Bootleg Canyon	N/A	66 (2.9) 1,627 (70)	N/A
River Mountains Loop Trail	4 crossings/8 miles	8 crossings/11.2 miles	6 crossings/10.7 miles

# Alternative IV-A (Applicant Proposed and Agency Preferred)

Alternative IV-A would cross dispersed recreation areas within the Las Vegas FO and Sloan Canyon NCA, four SRMAs, the Clark County Wetlands Park, and the Lake Mead NRA.

## BLM Dispersed Recreation Areas

General construction impacts to dispersed recreation activities are described in Section 3.13.6 and would affect recreationists by displacing visitors due to area closures, noise or visual presence of construction, or making the area inhospitable for wildlife. Within Region IV, the 250-foot-wide transmission line ROW for Alternative IV-A would impact 213 acres of dispersed recreation acreage in the Las Vegas FO. The 2-mile transmission line corridor, which represents the maximum area that could be temporarily removed from use during construction due to surface disturbance, increased noise, and human activity, would encompass 6,990 acres of dispersed recreation areas within the Las Vegas FO. These figures represent 0.01 percent and 0.04 percent of the acreage available for dispersed recreation in the FO, respectively. Construction would affect recreation use particularly on the weekends (Saturdays; there will be no construction on Sundays) and during the spring and fall when the weather is cooler and recreation use generally is higher in this area.

Key recreation opportunities within these dispersed recreation areas include equestrian trails in the area west of River Mountains ACEC (on city trails and the western portion of the River Mountains Loop Trail), which would be subject to noise and visual disturbances during construction and could have restricted access during peak construction times. Application of **REC-5** and **REC-6** would minimize impacts to trail users by prohibiting construction during weekends and other high use periods in areas that are adjacent to developed recreation sites and allowing users continued access to all or part of the trail system during construction. Operation of the line is expected to have little impact to recreation users because the line would be located parallel to an existing transmission line and therefore compatible with the existing viewshed. In general, within undesignated areas of the FO, there are other nearby locations that visitors could temporarily go during construction activities that offer the same recreation opportunities in a similar environment as are provided in dispersed recreation areas affected by Alternative IV-A.

## BLM SRMAs or Other Specially Managed Recreation Areas

Both the 250-foot-wide transmission line ROW and 2-mile transmission line corridor for Alternative IV-A would cross three SRMAs, affecting a maximum acreage of 11,155 acres within the 37,620-acre Sunrise Mountain SRMA (29.7 percent of the SRMA), 8,209 acres within the 197,300-acre Las Vegas Valley SRMA (4.2 percent of the SRMA) and 7,871 acres within the 91,600-acre Nelson/Eldorado SRMA (8.6 percent of the SRMA). The 2-mile transmission line corridor also would encompass 183 acres (1.2 percent) of the 10,000-acre Nellis Dunes SRMA. There are no identified high use areas in the analysis area within the Las Vegas Valley and Sunrise Mountain SRMAs; impacts would be similar to those described for dispersed recreation above. The Nellis Dunes and Nelson/Eldorado SRMAs offer high use OHV areas and specially permitted competitive OHV events. As areas of mostly motorized recreation, construction and operation of a transmission line is not expected to impact recreational use in these areas unless access to trails or use areas is restricted during key use times or specially permitted events. Application of **REC-2** would reduce the impact from road construction by limiting access within the SRMAs to existing roads or requiring closure or reclamation in consultation with the BLM. Application of REC-5, REC-6, and REC-9 would reduce impacts to recreation by prohibiting construction during high use times, keeping trails open or directing users to comparable trails, and scheduling construction outside of specially permitted events. Operation of the line is expected to have little impact to recreation users because there are already several existing transmission lines through affected portions of these SRMAs.

## Other Federally Managed Recreation Areas

<u>Lake Mead NRA</u>. Approximately 25 acres of the 2-mile transmission line corridor for Alternative IV-A would be within the Lake Mead NRA. The Lake Mead NRA offers year-round recreational opportunities for boating, fishing, hiking, photography, picnicking and sightseeing. The portion within the 2-mile corridor is in the far northwest corner of the NRA well away from these recreational opportunities and would not affect recreational experiences within the NRA.

Sloan Canyon NCA. Impacts to the 48,000-acre Sloan Canyon NCA are discussed in Section 3.15, Special Designation Areas; however, in general, the affected portions of the NCA within the 2-mile transmission line corridor (2,684 acres or 6 percent of the NCA) would be within areas managed for semi-primitive, non-motorized recreation and are classified as VRM Class II. Construction of roads would not be consistent with recreation management goals for this area. Application of **REC-2** would eliminate road construction within the NCA; however, recreation uses and users in the area closest to the 250-foot-wide transmission line ROW would still be temporarily affected by construction noise and activity. Application of **REC-5** and **REC-6** would minimize impacts to recreational drivers and visitors to the site by prohibiting construction during weekends and other high use periods in areas that are adjacent to developed recreation sites and allowing users continued access to all or part of the trail system during construction.

#### Local Recreation Areas

Clark County Wetlands Park. The 250-foot-wide transmission line ROW for Alternative IV-A would cross the Las Vegas Wash and impact 18 acres within the far-east portion of Clark County Wetlands Park, a nature and wildlife habitat viewing area. The 2-mile transmission line corridor also would encompass a total of 376 acres, or about 13 percent of the 2,900 acre park. Construction noise and visual disturbances would adversely affect wildlife watchers or other user groups seeking a natural environment and could affect use of trails in this affected portion of the park. Application of **REC-6** would reduce impacts by maintaining access to the majority of the trails in this area and/or redirecting users to other nearby trails where access is not restricted.

River Mountains Loop Trail. Alternative IV-A would cross the River Mountains Loop Trail 4 times; 3 times near Lake Mead Parkway and once at Highway 93 southeast of Henderson. Eight miles of this National Recreation Trail would be located within the 2-mile transmission line corridor. Trail users (hikers, bikers, equestrians) would be adversely affected by construction noise and activity along the trail, particularly in the spring and fall when the weather is cooler and recreation use is typically higher in this area. Use of the western portion of the trail may be affected if visitors choose to use other trails during construction. Operation of the transmission line would affect the visual setting for this National Millennium Trail. There currently are existing transmission lines at the Lake Mead Parkway crossing and the Highway 93 crossing, as well as along the base of the River Mountains on the western portion of the trail loop. Application of REC-2, REC-5, and REC-6 would assist in reducing impacts to the trail and impacts to non-motorized users from construction and operation by limiting access to existing roads, closing or rehabilitating new access roads, limiting construction times, and ensuring access to the trail is not impeded.

## Alternative IV-B

Alternative IV-B would cross dispersed recreation areas within the Las Vegas FO, four SRMAs, the Lake Mead NRA, a private golf course, and Bootleg Canyon Recreation Area.

## BLM Dispersed Recreation Areas

The 250-foot-wide transmission line ROW for Alternative IV-B would impact 190 acres of dispersed recreation area in the Las Vegas FO. The 2-mile transmission line corridor, which represents the maximum area that could be temporarily removed from use during construction due to surface disturbance, increased noise, and human activity, would encompass 6,765 acres of dispersed

recreation area within the Las Vegas FO. These figures represent 0.01 percent and 0.4 percent of the area available for dispersed recreation within the FO, respectively. Impacts to general dispersed recreation would be similar to those described under Alternative IV-A, but Alternative IV-B would impact only about a third of the acreage.

## BLM SRMAs or Other Specially Managed Recreation Areas

Both the 250-foot-wide transmission line ROW and 2-mile transmission line corridor for Alternative IV-B would cross three SRMAs, affecting a maximum acreage of 1,825 acres within the 37,620-acre Sunrise Mountain SRMA (4.9 percent of the SRMA), 535 acres within the 197,300-acre Las Vegas Valley SRMA (0.3 percent of the SRMA) and 3,498 acres within the 91,600-acre Nelson/Eldorado SRMA (3.8 percent of the SRMA). The 2-mile transmission line corridor also would encompass 183 acres (1.2 percent) of the 10,000-acre Nellis Dunes SRMA. Impacts would be similar to those described under Alternative IV-A, but would affect less acreage (less than 5 percent of the Las Vegas Valley and Sunrise Mountain SRMAs and about half the acreage within the Nelson/Eldorado SRMA affected by Alternative IV-A).

# Other Federally Managed Recreation Areas

Lake Mead NRA. Under Alternative IV-B, approximately 427 acres (14 miles) of the 250-foot-wide transmission line ROW and 12,871 acres of the 2-mile transmission line corridor would fall within the Lake Mead NRA. These acreages comprise less than 1 percent of the federally managed lands within the NRA, but would include developed access areas and scenic driving corridors within the Boulder Basin Zone offering year-round recreational opportunities for boating, fishing, hiking, photography, picnicking and sightseeing; primarily for day use recreation. During construction, noise and construction activities would adversely impact recreational non-motorized users in this area, such as campers, picnickers, and hikers using the Bluffs Trail, Wetlands Trail, the Historic Railroad Trail, or the River Mountains Loop Trail. The campground at Las Vegas Bay and the RV park at the Boulder Harbour/Beach would both be located within sight and earshot of construction activities. The nearest campground would be located approximately 12 miles further east, on the northern shore of the Boulder "arm." However, camping sites are limited and this location does not have any RV hookups. Additionally, the 250-foot-wide transmission line ROW would cross the access road for the boat launch and day use parking area. Restricted access to this area also would result in adverse impacts to motorized or non-motorized water-based user groups. Construction activities and noise also may affect use of the trails, campgrounds, boat launch, and day use area if visitors are displaced from these facilities. The 250-foot-wide transmission line ROW also largely parallels Lakeshore Drive within the Boulder Basin Zone. The 250-foot-wide transmission line ROW would be located primarily on the west side of the road, away from the shoreline; however, construction would affect the aesthetic quality of the drive and also would cause delays in traffic in this area. Construction would affect recreation use particularly on Saturdays (there will be no construction on Sundays). Application of REC-2 would reduce the impact from road construction by limiting access within the Boulder Basin Zone to existing roads or requiring closure or reclamation in consultation with the NPS. Application of REC-5 and **REC-6** would minimize impacts to recreational drivers and visitors to the site by prohibiting construction during weekends and other high use periods in areas that are adjacent to developed recreation sites and allowing users continued access to all or part of the trail system during construction. However, the visual impacts to the Class A scenery of the area would not comply with Lake Mead NRA management objectives and would result in permanent adverse impacts to the recreation setting in the area. Section 3.12, Visual Resources and Appendix I provide additional detail regarding visibility along the Lake Mead Boulevard Recreation Area.

#### Local Recreation Areas

<u>Cascata Golf Course</u>. Approximately 229 acres of the 431-acre Cascata Golf Course would fall within the 2-mile transmission line corridor in which roads or construction support areas could be located. This comprises about 53 percent of the property and includes almost all of the greens as well as the

club house. During construction, noise and construction activities would adversely impact the recreational setting of the golf course. There are other golf courses in nearby Boulder City that would be available for use during the construction phase (see Section 3.17, Social and Economic Conditions, for potential economic impacts of construction to the Cascata Golf Course). Application of **REC-2** would reduce the impact from road construction by limiting construction access near the golf course to existing roads or requiring closure or reclamation in consultation with the land manager. **REC-5** would minimize impacts to recreational users in the area by prohibiting construction during weekends and other high use periods in areas adjacent to developed recreation sites, but would not mitigate the long term adverse visual impacts resulting from placement of the transmission line within the area viewshed.

Bootleg Canyon. Alternative IV-B also would affect the mountain biking trails and zip line recreation opportunities in the 2,312-acre Bootleg Canyon recreation area. During construction, the 250-foot-wide transmission line ROW would affect 66 acres within this recreational area; approximately 1,627 acres of this recreational area (about 70 percent) would fall within the 2-mile transmission line corridor in which roads or construction support areas could be located. The 250-foot-wide transmission line ROW would cross several mountain bike trails and would be located less than a few hundred feet from one of the zipline platforms. There are other mountain biking trails in the general area, but not another area dedicated to mountain biking where there are so many high quality biking trails. There is a zip line in the City of Las Vegas across Fremont Street, but no known other "natural environment" zip lining opportunities in the Las Vegas/Boulder City area. Construction activities that prevent or restrict visitor's access to ziplining or mountain biking opportunities or degrade the experience through noise and other activities in Bootleg Canyon would cause a temporary adverse impact to recreation. Application of REC-2 would reduce impacts by the development of new roads in this area; however, it also is important to note that use of existing roads would be an adverse impact to recreation if that use conflicted with the current mountain biking recreational use of the area. Application of **REC-5** would minimize impacts to recreational users in the area by prohibiting construction during weekends and other high use periods in areas that are adjacent to developed recreation sites. During operation, the transmission line would be viewed by zipliners and those using certain mountain biking trails. Operations are assumed to have few adverse impacts for mountain bikers because they have a variety of trails to choose from and their recreational experience is based as much on the quality of the trails as it is the naturalness of the environment. However, ziplining relies heavily upon spectacular aerial views for user satisfaction; visual impacts to the areas nearest to the zipline would result in a permanent adverse impact to this user group. Section 3.12, Visual Resources and Appendix I provide additional detail regarding visibility in Bootleg Canyon. The following mitigation is recommended to reduce impacts to the ziplining and mountain biking recreational experience:

**REC-10**: The Applicant shall consider the view from key recreational areas in its placement of the 250-foot-wide transmission line ROW to locate the line where it best blends in with the surrounding environment, and/or is co-located with other existing transmission lines.

Moving the reference line to minimize the number of trails affected and avoiding the zipline activity area would reduce the impact to recreation at the site, particularly if the 250-foot-wide transmission line ROW were to be located closer to the existing transmission line, which is located further down the mountain.

River Mountains Loop Trail. Alterative IV-B would cross the River Mountains Loop Trail 8 times, mostly within the Lake Mead NRA on the eastern half of the trail. Portions of the transmission line would parallel the trail in two areas. Over 11 miles of this National Recreation Trail would be located within the 2-mile transmission line corridor. Trail users (hikers, bikers, equestrians) would be adversely affected by construction noise and activity along the trail, particularly in the spring and fall when the weather is cooler and recreation use is typically higher in this area. Use of the eastern portion of the trail may be affected if visitors choose to use other trails during construction. Operation of the transmission line would affect the visual setting for this National Millennium Trail; currently, there are

only existing transmission lines in the southeastern portion of the trail loop and along Highway 93 around Boulder City. Application of **REC-2**, **REC-5**, and **REC-6** would assist in reducing impacts to the trail and impacts to non-motorized users from construction and operation by limiting access to existing roads, closing or rehabilitating new access roads, limiting construction times, and ensuring access to the trail is not impeded.

#### Scenic Backways and Byways

Although there are no designated National Scenic Byways or BLM-designated Scenic Byways or Backways within Region IV, the Nevada Commission on Tourism is currently facilitating the nomination of Lakeshore and Northshore Roads within Lake Mead NRA for State Scenic Byway status. The nomination is primarily honoring the scenic, cultural, and natural features found along these road corridors. Alternative IV-B would be located along Lakeshore Road within the Lake Mead NRA. Construction and operation (presence) of the transmission line would affect the scenic quality of the road and thus could affect the nomination as a Nevada Scenic Byway.

# Alternative IV-C

Alternative IV-C would cross dispersed recreation areas within the Las Vegas FO, three SRMAs, and the Lake Mead NRA.

#### BLM Dispersed Recreation Areas

The 250-foot-wide transmission line ROW for Alternative IV-C would impact 190 acres of dispersed recreation area in the 2.4 million-acre Las Vegas FO. The 2-mile transmission line corridor, which represents the maximum area that could be temporarily removed from use during construction due to surface disturbance, increased noise, and human activity, would encompass 6,765 acres of dispersed recreation area within the Las Vegas FO. These figures represent 0.01 percent and 0.4 percent of the area available for dispersed recreation in the FO, respectively. Impacts to general dispersed recreation would be similar those described under Alternative IV-A, but Alternative IV-C would only impact about a third of the acreage of Alternative IV-A.

#### BLM SRMAs or Other Specially Managed Recreation Areas

Both the 250-foot-wide transmission line ROW and 2-mile transmission line corridor for Alternative IV-C would cross the Sunrise Mountain SRMA. Impacts would be the same as those described under Alternative IV-B. The 2-mile transmission line corridor also would encompass 183 acres of the Nellis Dunes SRMA. Impacts would be the same as those described under Alternative IV-A. The 2-mile transmission line corridor also would encompass approximately 29 acres of the Nelson/Eldorado SRMA. This would have minimal impact on recreation in this area, due to the small amount of acreage that would be subject to noise and construction activity.

## Other Federally Managed Recreation Areas

<u>Lake Mead NRA</u>. Under Alternative IV-C, approximately 414 acres (14 miles) of the 250-foot-wide transmission line ROW and 14,482 acres of the 2-mile transmission line corridor would fall within the Lake Mead NRA. Impacts would be similar in context and intensity those described under Alternative IV-B.

<u>Black Canyon</u>. The 2-mile transmission line corridor would include almost 1,000 acres of the Black Canyon Wilderness (see Section 3.15, Special Designation Areas). Construction of roads in this portion of the 2-mile transmission line corridor would conflict with wilderness area management; roads would need to be placed outside of wilderness boundaries. During construction, the recreation setting of scenic, undeveloped, and natural areas within and near the wilderness area would be adversely affected by noise and construction activity. Operation of the transmission line also is expected to have

permanent impacts to non-motorized user groups seeking to recreate in and near natural wilderness areas because there are no existing transmission lines in the area.

#### Local Recreation Areas

River Mountains Loop Trail. Alterative IV-C would cross the River Mountains Loop Trail 6 times, entirely within the Lake Mead NRA on the eastern half of the trail. Portions of the transmission line would parallel the trail in two areas. Over 10 miles of this National Recreation Trail would be located within the 2-mile transmission line corridor. Trail users (hikers, bikers, equestrians) would be adversely affected by construction noise and activity along the trail, particularly in the spring and fall when the weather is cooler and recreation use is typically higher in this area. Use of the eastern portion of the trail may be affected if visitors choose to use other trails during construction. Operation of the transmission line would affect the visual setting for this National Millennium Trail; currently, there are only existing transmission lines in the southeastern portion of the trail loop. Application of REC-2, REC-5, and REC-6 would assist in reducing impacts to the trail and impacts to non-motorized users from construction and operation by limiting access to existing roads, closing or rehabilitating new access roads, limiting construction times, and ensuring access to the trail is not impeded.

#### Scenic Backways and Byways

Impacts to Lakeshore Road would be the same as those described under Alternative IV-B.

#### Alternative Variations in Region IV

**Table 3.13-33** summarizes impacts associated with the use of the Marketplace Alternative Variation in Region IV.

Table 3.13-35 Summary of Region IV Alternative Variation Impacts to Recreation

Analysis
Under this variation, 94 acres of the 250-foot-wide transmission line ROW and 2,984 acres of the 2-mile transmission line corridor would fall within the Nelson/Eldorado SRMA. This variation would have more acreage within the SRMA than Alternative IV-B: 94 acres more of 250-foot-wide transmission line ROW (which does not enter the SRMA for Alternative IV-B), and 2,836 acres more of 2-mile transmission line corridor, with correspondingly larger impacts to recreation within the SRMA through surface disturbance and temporary access restrictions. Impacts would be greatest to OHV users and other motorized user groups.
1

# Alternative Connectors in Region IV

**Table 3.13-34** summarizes impacts associated with the use of the alternative connectors in Region IV. All alternative connectors, except the Railroad Pass Alternative Connector, would affect one SRMA and the Lake Mead NRA. The Sunrise Mountain Alternative Connector is the only connector that would not affect the River Mountains Loop Trail. The River Mountains Alternative Connector also would affect Bootleg Canyon and backcountry road use in the Lake Mead NRA. The Railroad Pass Alternative Connector would affect two BLM SRMAs as well as a private golf course.

Table 3.13-36 Summary of Region IV Alternative Connector Impacts to Recreation

Alternative Connector	Analysis
Sunrise Mountain Alternative Connector	250-foot-wide transmission line ROW:
	Sunrise Mountain SRMA: 77 acres
	2-mile transmission line corridor:
	Sunrise Mountain SRMA: 1,284 acres
	Lake Mead NRA: 882 acres
Lake Las Vegas Alternative Connector	250-foot-wide transmission line ROW:
	Las Vegas Valley SRMA: 76 acres
	Lake Mead NRA: 42 acres
	2-mile transmission line corridor:
	Las Vegas Valley SRMA: 1,277 acres
	Lake Mead NRA: 364 acres
	Would affect the River Mountains Loop Trail
Three Kids Mine Alternative Connector	250-foot-wide transmission line ROW:
	Las Vegas Valley SRMA: 123 acres
	Lake Mead NRA: 36 acres
	2-mile transmission line corridor:
	Las Vegas Valley SRMA: 1,455 acres
	Lake Mead NRA: 441 acres
	Would affect the River Mountains Loop Trail
River Mountains Alternative Connector	250-foot-wide transmission line ROW:
	Las Vegas Valley SRMA: 77 acres
	Lake Mead NRA: 131 acres
	2-mile transmission line corridor:
	Las Vegas Valley SRMA: 2,143 acres
	Lake Mead NRA: 3,320 acres
	Bootleg Canyon: 291 acres
	Affects backcountry road use in the Lake Mead NRA and the River Mountains Loop
	Trail
Railroad Pass Alternative Connector	250-foot-wide transmission line ROW:
(Alternatives IV-A and IV-B)	Las Vegas Valley SRMA: 41 acres
	Nelson/Eldorado SRMA: 47 acres
	2-mile transmission line corridor:
	Cascata Golf Course: 190 acres
	Las Vegas SRMA: 1,009 acres
	Nelson/Eldorado SRMA: 1,321 acres
	Would affect the River Mountains Loop Trail

# Region IV Conclusion

Though Alternative IV-B would affect the same number of recreation areas as Alternative IV-A, Alternative IV-B would have a greater impact on the River Mountains Loop Trail with a higher number of trail crossings and miles affected. Alternative IV-C would affect the fewest recreation areas, but also would have an increased impact on the River Mountains Loop Trail from Alternative IV-A due to a higher number of trail crossings and miles affected. In addition, Alternatives IV-B and IV-C would permanently affect the recreation setting of the trail in an area with no existing transmission lines. In comparison to Alternative IV-C, Alternative IV-A (Applicant Proposed, Agency Preferred) would affect additional BLM recreation areas and the Clark County Wetlands Park, would affect less NRA acreage,

and would have a lesser impact on the River Mountains Loop Trail as fewer miles would be impacted, there would be fewer trail crossings, and there are existing transmission lines along much of the trail portion that would be affected by Alternative IV-A.

## 3.13.6.13 Impacts to Recreation from the No Action Alternative

Under the No Action Alternative, the Project would not be constructed and current management across the analysis area would be maintained. Therefore, no construction, operation, or decommissioning impacts to recreation would occur from the Project and recreation opportunities and experiences would continue as is throughout the analysis area.

#### 3.13.6.14 Residual Effects

Mitigation related to construction activities would reduce impacts to dispersed recreation and recreation at designated sites by maintaining public access to key recreational areas, scheduling construction around key recreational events or high use times or seasons, limiting new access road locations, and scheduling vegetation maintenance outside of big game hunting season. Residual effects from construction would consist of temporary disruption of recreation activities through noise and construction activity, and travel or access delays, particularly during non-high use times or within non-high use areas. Residual effects from operation of the transmission line itself would be the same as those described under each action alternative and would consist primarily of visual impacts from the line itself. There would be no residual effects to designated recreation areas from road development if mitigation limiting access to existing roads is applied. In cases where access road development is not fully avoided, but rather limited to existing corridors and/or subject to closure/rehabilitation, residential impacts would include wildlife habitat loss, visual impacts, and potential for unauthorized OHV use. Mitigation related to maintenance activities would reduce impacts to key hunting areas during big game hunting seasons, but would not reduce impacts to other recreational activities occurring during the rest of the year. Impacts would consist of noise and human activity that would interfere with recreational activities, especially activities relying on quiet or solitude.

#### 3.13.6.15 Irreversible and Irretrievable Commitments of Resources

All operational impacts to recreation described above would be irretrievable until transmission line decommissioning, after which time the recreational values of the transmission line area would be fully reclaimed.

## 3.13.6.16 Relationship Between Local Short-term Uses and Long-term Productivity

Implementation of the project would result in the conversion of some project lands from existing recreational uses to use as ROW corridors. Long-term productivity of project lands for recreation would be largely unaffected except for areas of high visual quality. In these areas, long term productivity of lands for recreation would be impacted if the surrounding land use shifted to a more industrial use as a result of the transmission line placement.
